

CHR70M

70MP ultra high resolution image sensor

SENSOR DESCRIPTION

The CHR70M is a high resolution CMOS image sensor with 10000 by 7096 pixels. The image array consists of $3.1\mu\text{m} \times 3.1\mu\text{m}$ pinned diode pixels, which share a number of transistors (2 pixels sharing). The image sensor has 8 analog outputs, each running at 30MHz resulting in a frame rate of 3fps at full resolution. Higher frame rates can be achieved in windowing mode or subsampling mode. The image sensor also integrates a programmable gain amplifier and offset regulation. These and other settings are all programmable using the SPI interface. A programmable on-board sequencer generates all internal exposure and read out timings. External triggering and exposure programming is also possible.
