## Power Factor Characteristics

## Dimming Control

Parameter	Min.	Typ.	Max.	Notes
<b>12V output voltage (Vaux)</b>	10.8V	12V	13.2V	
<b>Vaux source current</b>	10 mA	15mA	20 mA	
<b>Absolute maximum voltage</b>	-2 V	-	15V	
<b>On the 0~10 input pin</b>				
<b>Source current on 0~10V input pin</b>	150 uA	200 uA	250 uA	

The dimmer control is operated from an input signal of 1-10 Vdc. Recommended implementations are provided below.

## Implementation

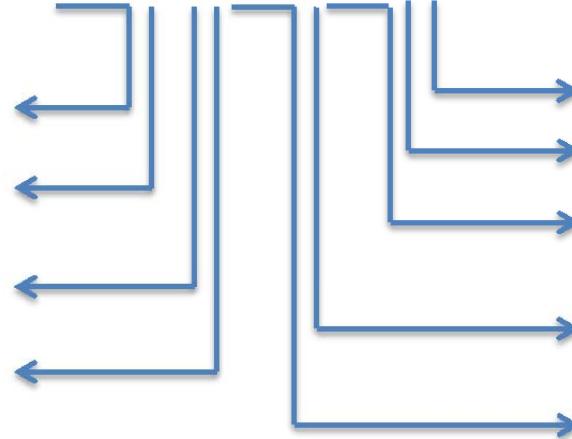

Notes:

1. The dimmer can also be replaced by an active 0-10V voltage source signal or passive components like resistors and zener.
2. The dimming signal is allowed to be less than 1V, when it is between 0 and 1V, the output level is 10%.
3. Do NOT connect the Gray Wire (Dim-) to Blue Wire (V-) together.
4. The dimming section is not isolated with output.
5. If 0-10V dimming is not used, Dim + can be either open or connected to Vaux.
