THERMAL TIME CONSTANT

CIRCUIT SCHEMATIC

* The ratio, at a specified ambient temperature, of the change in the power dissipation of the sensor to the resultant temperature change of the thermistor. Test medium: silicone oil

** The time required for the sensor to achieve 63.2% of its steady state value when subjected to a step change in ambient temperature [$T_c = (T_f - T_i) * 63.2\% + T_i$]. Test medium: silicone oil.

Important: The values above are for the unloaded thermistor, as shipped from Merit Automotive Electronics Systems, and does not reflect the effects of application system errors and aging.

Notes: Please contact Merit Automotive Engineering for the resistance vs temperature curve for your temperature sensor application. Due to self-heating effects of the thermistor, the resistance is dependant upon the application.

Since thermistors are "continuous function devices", resistance vs temperature data is available for numbers beyond those specified above.
