

---

---

**16-Bit Digital Signal Controllers with High-Speed ADC, Op Amps, Comparators and High-Resolution PWM**

---

---

**Operating Conditions**

- 3.0V to 3.6V: -40°C to +125°C, DC to 100 MIPS
- 3.0V to 3.6V: -40°C to +150°C, DC to 70 MIPS

**High-Performance 16-Bit DSP RISC CPU**

- 16-Bit Wide Data Path
- Code Efficient (C and Assembly) Architecture
- 40-Bit Wide Accumulators
- Single-Cycle (MAC/MPY) with Dual Data Fetch
- Single-Cycle, Mixed-Sign Multiply:
  - 32-bit multiply support
- Fast Six-Cycle Divide
- Zero Overhead Looping

**High-Resolution PWM**

- Four PWM Pairs
- Up to 2 ns PWM Resolution
- Dead Time for Rising and Falling Edges
- Dead-Time Compensation
- Clock Chopping for High-Frequency Operation
- PWM Support for:
  - DC/DC, AC/DC, inverters, PFC, lighting
  - BLDC, PMSM, ACIM, SRM motors
- Fault and Current Limit Inputs
- Flexible Trigger Configuration for ADC Triggering

**High-Speed Analog-to-Digital Converter**

- Up to 15 A/D inputs
- 12-Bit Resolution
- One Shared SAR ADC Core
- Up to 3.5 Msp/s Conversion Rate per Core
- Dedicated Result Buffer for Each Analog Channel
- Flexible and Independent ADC Trigger Sources
- Four Digital Comparators
- Four Oversampling Filters

**Microcontroller Features**

- Small Pin Count Packages Ranging from 28 to 48 Pins, Including UQFN as Small as 4x4 mm
- High-Current I/O Sink/Source
- Edge or Level Change Notification Interrupt on I/O Pins
- Peripheral Pin Select (PPS) Remappable Pins
- Up to 64 Kbytes Flash Memory:
  - 10,000 erase/write cycle endurance
  - 20 years minimum data retention
  - Self-programmable under software control
  - Programmable code protection
  - Error Code Correction (ECC)
  - Flash OTP by ICSP™ Write Inhibit
- Eight Kbytes SRAM Memory:
  - SRAM Memory Built-In Self-Test (MBIST)
- Multiple Interrupt Vectors with Individually Programmable Priority
- Four Sets of Interrupt Context Saving Registers which Include Accumulator and STATUS for Fast Reserved Interrupt Handling
- Four External Interrupt Pins
- Watchdog Timer (WDT)
- Windowed Deadman Timer (DMT)
- Fail-Safe Clock Monitor (FSCM) with Dedicated Oscillator
- Selectable Oscillator Options Including:
  - High-precision, 8 MHz internal Fast RC (FRC) Oscillator
  - Primary high-speed, crystal/resonator oscillator or external clock
  - Primary PLL, which can be clocked from FRC or crystal oscillator
- Low-Power Management modes (Sleep and Idle)
- Power-on Reset and Brown-out Reset
- On-Board Capacitorless Regulator
- 384 Bytes of One-Time-Programmable (OTP) Memory

# dsPIC33CK64MC105 FAMILY

---

## Peripheral Features

- Two Four-Wire SPI modules (up to 50 Mbps):
  - 16-byte FIFO
  - Variable width
  - I<sup>2</sup>S mode
- One I<sup>2</sup>C Host and Client w/Address Masking and IPMI Support
- Three Protocol UARTs with Automated Handling Support for:
  - LIN 2.2
  - DMX
  - Smart card (ISO 7816)
- One SENT module
- Timers/Counters:
  - One dedicated 16-bit timer/counter
- Four Single Output Capture/Compare/PWM/Timer (SCCP) modules:
  - Flexible configuration as PWM, input capture, output compare or timers
  - Two 16-bit timers or one 32-bit timer in each module
  - PWM resolution down to 2.5 ns
  - Single PWM output
- One Quadrature Encoder Interface (QEI):
  - Four inputs: Phase A, Phase B, Home, Index
  - One 32-bit timer/counter (in QEI module, available if encoder is not used)
- Reference Clock Output (REFCLKO)
- Four Configurable Logic Cells (CLC) with Internal Connections to Select Peripherals and PPS
- Four-Channel Hardware DMA
- 32-Bit CRC Calculation module
- Peripheral Trigger Generator (PTG):
  - 16 possible trigger sources to other peripheral modules
  - CPU-independent state machine-based instruction sequencer
  - Two 16-bit general purpose timers

## Analog Features

- One Fast Analog Comparator with Input Multiplexing
- Three Operational Amplifiers
- One 12-Bit PDM DAC with Slope Compensation
- One Output DAC Buffer

## Debug Features

- Three Programming and Debugging Interfaces:
  - Two-wire ICSP™ interface with non-intrusive access and real-time data exchange with application
- Three Complex, Five Simple Breakpoints
- IEEE Standard 1149.2 Compatible (JTAG) Boundary Scan

## Safety Features

- Backup Fast RC Oscillator (BFRC)
- Brown-out Reset (BOR)
- Capless Internal Voltage Regulator
- Clock Monitor System with Backup Oscillator
- CodeGuard™ Security
- Cyclic Redundancy Check (CRC)
- Dual Watchdog Timer (WDT)
- Fail-Safe Clock Monitoring (FSCM)
- Flash Error Correcting Code (ECC)
- Flash OTP by ICSP™ Write Inhibit
- RAM Memory Built-In Self-Test (MBIST)
- Two-Speed Start-up
- Virtual Pins for Redundancy and Monitoring
- Windowed Deadman Timer (DMT)

## Functional Safety Collaterals

- Class B Safety Library – IEC 60730
- For ASIL B and Beyond Applications – ISO 26262
- FMEDA Computation Spreadsheet (evaluation of Random Hardware Failures Metric)
- Functional Safety Manual
- Functional Safety Diagnostics Suite

## Qualification

- AEC-Q100 REV G (Grade 1: -40°C to +125°C)
- AEC-Q100 REV G (Grade 0: -40°C to +150°C)

## dsPIC33CK64MC105 PRODUCT FAMILIES

The device names, pin counts, memory sizes and peripheral availability of each device are listed in [Table 1](#). The following pages show their pinout diagrams.

**TABLE 1: dsPIC33CK64MC105 FAMILY**

Product	Pins	Program Memory	Data Memory	General Purpose I/O/PPS	High-Resolution PWM (Generators)	12-Bit ADC (External Channels)	Remappable Peripherals					Op Amplifiers	Comparators	12-Bit DACs	I <sup>2</sup> C	QEI	SENT	32-Bit CRC	PTG	Current Bias Generator	DMA (Channels)	Packages
							Dedicated 16-Bit Timers <sup>(3)</sup>	UARTs	SCCP <sup>(1)</sup>	CLC	SPI/I <sup>2</sup> S											
dsPIC33CK32MC102	28	32K	8K	21/16	4	11 <sup>(2)</sup>	1	3	4	4	2	2	1	1	1	1	1	1	1	4	SSOP/UQFN	
dsPIC33CK32MC103	36	32K	8K	27/22	4	15 <sup>(2)</sup>	1	3	4	4	2	3	1	1	1	1	1	1	1	4	UQFN	
dsPIC33CK32MC105	48	32K	8K	39/34	4	15 <sup>(2)</sup>	1	3	4	4	2	3	1	1	1	1	1	1	1	4	UQFN/TQFP	
dsPIC33CK64MC102	28	64K	8K	21/16	4	11 <sup>(2)</sup>	1	3	4	4	2	2	1	1	1	1	1	1	1	4	SSOP/UQFN	
dsPIC33CK64MC103	36	64K	8K	27/22	4	15 <sup>(2)</sup>	1	3	4	4	2	3	1	1	1	1	1	1	1	4	UQFN	
dsPIC33CK64MC105	48	64K	8K	39/34	4	15 <sup>(2)</sup>	1	3	4	4	2	3	1	1	1	1	1	1	1	4	UQFN/TQFP	

**Note 1:** SCCP can be configured as a PWM with one output, input capture, output compare, 2 x 16-bit timers or 1 x 32-bit timer.

**2:** Analog ADC inputs AN1 and AN7 share the same pin.

**3:** In addition to the dedicated 16-bit timer, the SCCP module contains eight more 16-bit timers and two more are available in the PTG module. A 32-bit timer is located in the QEI module and the SCCP module timers can also be configured as four 32-bit timers.

## Pin Diagrams

### 28-Pin SSOP

**Legend:** Shaded pins are up to 5 VDC tolerant.

**TABLE 2: 28-PIN SSOP COMPLETE PIN FUNCTION DESCRIPTIONS**

Pin #	Function <sup>(1)</sup>	Pin #	Function <sup>(1)</sup>
1	OA1IN-/RA1	15	PGC3/RP38/RB6
2	OA1IN+/AN9/RA2	16	TDO/AN2/RP39/RB7
3	DACOUT/AN3/CMP1C/RA3	17	PGD1/AN10/RP40/SCL1/RB8
4	AN4/IBIAS3/RA4	18	PGC1/AN11/RP41/SDA1/RB9
5	AVDD	19	VSS
6	AVSS	20	VDD
7	VDD	21	TMS/RP42/PWM3H/RB10 <sup>(3)</sup>
8	VSS	22	TCK/RP43/PWM3L/RB11
9	OSCI/CLKI/AN5/RP32/RB0	23	TDI/RP44/PWM2H/RB12
10	OSCO/CLKO/AN6/RP33/RB1 <sup>(2,4)</sup>	24	RP45/PWM2L/RB13
11	OA2OUT/AN1/AN7/CMP1D/RP34/INT0/RB2	25	RP46/PWM1H/RB14
12	PGD2/OA2IN-/AN8/RP35/RB3	26	RP47/PWM1L/RB15
13	PGC2/OA2IN+/RP36/RB4	27	MCLR
14	PGD3/RP37/RB5	28	OA1OUT/AN0/CMP1A/IBIAS0/RA0

**Note 1:** RPn represents remappable peripheral functions.

**2:** Pin has an increased current drive strength. Refer to [Section 31.0 “Electrical Characteristics”](#) for details.

**3:** A pull-up resistor is connected to this pin during programming or when JTAG is enabled in the Configuration bits; this limits the maximum voltage on this pin to 3.6V. If JTAG is disabled, the maximum voltage on this pin can reach 5.5V.

**4:** This pin is toggled during programming.

## TO OUR VALUED CUSTOMERS

It is our intention to provide our valued customers with the best documentation possible to ensure successful use of your Microchip products. To this end, we will continue to improve our publications to better suit your needs. Our publications will be refined and enhanced as new volumes and updates are introduced.

If you have any questions or comments regarding this publication, please contact the Marketing Communications Department via E-mail at [docerrors@microchip.com](mailto:docerrors@microchip.com). We welcome your feedback.

### Most Current Data Sheet

To obtain the most up-to-date version of this data sheet, please register at our Worldwide Website at:

<http://www.microchip.com>

You can determine the version of a data sheet by examining its literature number found on the bottom outside corner of any page. The last character of the literature number is the version number, (e.g., DS30000000A is version A of document DS30000000).

### Errata

An errata sheet, describing minor operational differences from the data sheet and recommended workarounds, may exist for current devices. As device/documentation issues become known to us, we will publish an errata sheet. The errata will specify the revision of silicon and revision of document to which it applies.

To determine if an errata sheet exists for a particular device, please check with one of the following:

- Microchip's Worldwide Website; <http://www.microchip.com>
- Your local Microchip sales office (see last page)

When contacting a sales office, please specify which device, revision of silicon and data sheet (include literature number) you are using.

### Customer Notification System

Register on our website at [www.microchip.com](http://www.microchip.com) to receive the most current information on all of our products.

## Referenced Sources

This device data sheet is based on the following individual chapters of the “*dsPIC33/PIC24 Family Reference Manual*”. These documents should be considered as the general reference for the operation of a particular module or device feature.

**Note:** To access the documents listed below, browse to the documentation section of the dsPIC33CK64MC105 product page of the Microchip website ([www.microchip.com](http://www.microchip.com)) or select a family reference manual section from the following list.

In addition to parameters, features and other documentation, the resulting page provides links to the related family reference manual sections.

- “Introduction” ([www.microchip.com/DS70573](http://www.microchip.com/DS70573))

## 1.0 DEVICE OVERVIEW

**Note 1:** This data sheet summarizes the features of the dsPIC33CK64MC105 family of devices. It is not intended to be a comprehensive resource. To complement the information in this data sheet, refer to the related section of the “dsPIC33/PIC24 Family Reference Manual”, which is available from the Microchip website ([www.microchip.com](http://www.microchip.com)).

**2:** Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

This document contains device-specific information for the dsPIC33CK64MC105 Digital Signal Controller (DSC) and Microcontroller (MCU) devices.

dsPIC33CK64MC105 devices contain extensive Digital Signal Processor (DSP) functionality with a high-performance, 16-bit MCU architecture.

Figure 1-1 shows a general block diagram of the core and peripheral modules of the dsPIC33CK64MC105 family. Table 1-1 lists the functions of the various pins shown in the pinout diagrams.

**FIGURE 1-1: dsPIC33CK64MC105 FAMILY BLOCK DIAGRAM<sup>(1)</sup>**

**TABLE 1-1: PINOUT I/O DESCRIPTIONS**

Pin Name <sup>(1)</sup>	Pin Type	Buffer Type	PPS	Description
AN0-AN15	I	Analog	No	Analog input channels.
ANN0	I	Analog	No	Analog negative input.
CLKI	I	ST	No	External Clock (EC) source input. Always associated with OSCI pin function.
CLKO	O	—	No	In Configuration bits, it can be set to output the CPU clock. Always associated with OSCO pin function.
OSCI	I	CMOS	No	Oscillator crystal input. Connects to crystal or resonator in Crystal Oscillator mode.
OSCO	I/O	—	No	Oscillator crystal output. Connects to crystal or resonator in Crystal Oscillator mode.
REFCLKI	I	ST	Yes	Reference clock input.
REFCLKO	O	—	Yes	Reference clock output.
INT0	I	ST	No	External Interrupt 0.
INT1	I	ST	Yes	External Interrupt 1.
INT2	I	ST	Yes	External Interrupt 2.
INT3	I	ST	Yes	External Interrupt 3.
IOCA[4:0]	I	ST	No	Interrupt-on-Change input for PORTA.
IOCB[15:0]	I	ST	No	Interrupt-on-Change input for PORTB.
IOCC[13:0]	I	ST	No	Interrupt-on-Change input for PORTC.
IOCD1, IOCD8, IOCD10 IOCD13	I	ST	No	Interrupt-on-Change input for PORTD.
QEIAx	I	ST	Yes	QEIx Input A.
QEIBx	I	ST	Yes	QEIx Input B.
QEINDXx	I	ST	Yes	QEIx Index input.
QEIHOMx	I	ST	Yes	QEIx Home input.
QEICMPx	O	—	Yes	QEIx comparator output.
RP32-RP61, RP65, RP72, RP77	I/O	ST	Yes	Remappable I/O ports.
RA0-RA4	I/O	ST	No	PORTA is a bidirectional I/O port.
RB0-RB15	I/O	ST	No	PORTB is a bidirectional I/O port.
RC0-RC13	I/O	ST	No	PORTC is a bidirectional I/O port.
RD1, RD8, RD10, RD13	I/O	ST	No	PORTD is a bidirectional I/O port.
T1CK	I	ST	Yes	Timer1 external clock input.
U1CTS	I	ST	Yes	UART1 Clear-to-Send.
U1RTS	O	—	Yes	UART1 Request-to-Send.
U1RX	I	ST	Yes	UART1 receive.
U1TX	O	—	Yes	UART1 transmit.
U1DSR	I	ST	Yes	UART1 Data-Set-Ready.
U1DTR	O	—	Yes	UART1 Data-Terminal-Ready.
U2CTS	I	ST	Yes	UART2 Clear-to-Send.
U2RTS	O	—	Yes	UART2 Request-to-Send.
U2RX	I	ST	Yes	UART2 receive.
U2TX	O	—	Yes	UART2 transmit.
U2DSR	I	ST	Yes	UART2 Data-Set-Ready.
U2DTR	O	—	Yes	UART2 Data-Terminal-Ready.

**Legend:** CMOS = CMOS compatible input or output      Analog = Analog input      P = Power  
 ST = Schmitt Trigger input with CMOS levels      O = Output      I = Input  
 PPS = Peripheral Pin Select

- Note 1:** Not all pins are available in all package variants. See the “Pin Diagrams” section for pin availability.  
**2:** PWM4L and PWM4H pins are available on PPS.  
**3:** SPI2 supports dedicated pins as well as PPS on 48-pin devices.

**TABLE 1-1: PINOUT I/O DESCRIPTIONS (CONTINUED)**

Pin Name <sup>(1)</sup>	Pin Type	Buffer Type	PPS	Description
U3CTS	I	ST	Yes	UART3 Clear-to-Send.
U3RTS	O	—	Yes	UART3 Request-to-Send.
U3RX	I	ST	Yes	UART3 receive.
U3TX	O	—	Yes	UART3 transmit.
U3DSR	I	ST	Yes	UART3 Data-Set-Ready.
U3DTR	O	—	Yes	UART3 Data-Terminal-Ready.
SENT1	I	ST	Yes	SENT1 input.
SENT1OUT	O	—	Yes	SENT1 output.
PTGTRG24	O	—	Yes	PTG Trigger Output 24.
PTGTRG25	O	—	Yes	PTG Trigger Output 25.
TCKI1-TCKI4	I	ST	Yes	SCCP timer inputs.
ICM1-ICM4	I	ST	Yes	SCCP capture inputs.
OCFA-OCFB	I	ST	Yes	SCCP Fault inputs.
OCM1x-OCM4x	O	—	Yes	SCCP compare outputs.
SCK1	I/O	ST	Yes	Synchronous serial clock input/output for SPI1.
SDI1	I	ST	Yes	SPI1 data in.
SDO1	O	—	Yes	SPI1 data out.
SS1	I/O	ST	Yes	SPI1 Client synchronization or frame pulse I/O.
SCK2	I/O	ST	Yes <sup>(3)</sup>	Synchronous serial clock input/output for SPI2.
SDI2	I	ST	Yes <sup>(3)</sup>	SPI2 data in.
SDO2	O	—	Yes <sup>(3)</sup>	SPI2 data out.
SS2	I/O	ST	Yes <sup>(3)</sup>	SPI2 Client synchronization or frame pulse I/O.
SCL1	I/O	ST	No	Synchronous serial clock input/output for I2C1.
SDA1	I/O	ST	No	Synchronous serial data input/output for I2C1.
ASCL1	I/O	ST	No	Alternate synchronous serial clock input/output for I2C1.
ASDA1	I/O	ST	No	Alternate synchronous serial data input/output for I2C1.
TMS	I	ST	No	JTAG Test mode select pin.
TCK	I	ST	No	JTAG test clock input pin.
TDI	I	ST	No	JTAG test data input pin.
TDO	O	—	No	JTAG test data output pin.
PCI8-PCI18	I	ST	Yes	PWM Inputs 8 through 18.
PCI19	I	ST	No	PWM Input 19.
PWMEA-PWMED	O	—	Yes	PWM Event Outputs A through D.
PWM1L-PWM4L <sup>(2)</sup>	O	—	No	PWM Low Outputs 1 through 4.
PWM1H-PWM4H <sup>(2)</sup>	O	—	No	PWM High Outputs 1 through 4.
CLCINA-CLCIND	I	ST	Yes	CLC Inputs A through D.
CLCxOUT	O	—	Yes	CLCx output.
CMP1A	I	Analog	No	Comparator Channel 1A.
CMP1B	I	Analog	No	Comparator Channel 1B.
CMP1C	I	Analog	No	Comparator Channel 1C.
CMP1D	I	Analog	No	Comparator Channel 1D.

**Legend:** CMOS = CMOS compatible input or output      Analog = Analog input      P = Power

**2:** PWM4L and PWM4H pins are available on PPS.  
**3:** SPI2 supports dedicated pins as well as PPS on 48-pin devices.

## 2.0 GUIDELINES FOR GETTING STARTED WITH 16-BIT DIGITAL SIGNAL CONTROLLERS

### 2.1 Basic Connection Requirements

Getting started with the dsPIC33CK64MC105 family devices requires attention to a minimal set of device pin connections before proceeding with development. The following is a list of pin names which must always be connected:

- All VDD and VSS pins (see [Section 2.2 “Decoupling Capacitors”](#))
- All AVDD and AVSS pins regardless if ADC module is not used (see [Section 2.2 “Decoupling Capacitors”](#))
- MCLR pin (see [Section 2.3 “Master Clear \(MCLR\) Pin”](#))
- PGCx/PGDx pins used for In-Circuit Serial Programming™ (ICSP™) and debugging purposes (see [Section 2.4 “ICSP Pins”](#))
- OSCI and OSCO pins when an external oscillator source is used (see [Section 2.5 “External Oscillator Pins”](#))

### 2.2 Decoupling Capacitors

The use of decoupling capacitors on every pair of power supply pins, such as VDD, VSS, AVDD and AVSS is required.

Consider the following criteria when using decoupling capacitors:

- **Value and type of capacitor:** Recommendation of 0.1  $\mu\text{F}$  (100 nF), 10-20V. This capacitor should be a low-ESR and have resonance frequency in the range of 20 MHz and higher. It is recommended to use ceramic capacitors.
- **Placement on the Printed Circuit Board:** The decoupling capacitors should be placed as close to the pins as possible. It is recommended to place the capacitors on the same side of the board as the device. If space is constricted, the capacitor can be placed on another layer on the PCB using a via; however, ensure that the trace length from the pin to the capacitor is within one-quarter inch (6 mm) in length.
- **Handling high-frequency noise:** If the board is experiencing high-frequency noise, above tens of MHz, add a second ceramic-type capacitor in parallel to the above described decoupling capacitor. The value of the second capacitor can be in the range of 0.01  $\mu\text{F}$  to 0.001  $\mu\text{F}$ . Place this second capacitor next to the primary decoupling capacitor. In high-speed circuit designs, consider implementing a decade pair of capacitances as close to the power and ground pins as possible. For example, 0.1  $\mu\text{F}$  in parallel with 0.001  $\mu\text{F}$ .
- **Maximizing performance:** On the board layout from the power supply circuit, run the power and return traces to the decoupling capacitors first, and then to the device pins. This ensures that the decoupling capacitors are first in the power chain. Equally important is to keep the trace length between the capacitor and the power pins to a minimum, thereby reducing PCB track inductance.

# dsPIC33CK64MC105 FAMILY

**FIGURE 2-1: RECOMMENDED MINIMUM CONNECTION**

## 2.2.1 BULK CAPACITORS

On boards with power traces running longer than six inches in length, it is suggested to use a bulk capacitor for integrated circuits, including DSCs, to supply a local power source. The value of the bulk capacitor should be determined based on the trace resistance that connects the power supply source to the device and the maximum current drawn by the device in the application. In other words, select the bulk capacitor so that it meets the acceptable voltage sag at the device. Typical values range from 4.7  $\mu\text{F}$  to 47  $\mu\text{F}$ .

## 2.3 Master Clear ( $\overline{\text{MCLR}}$ ) Pin

The  $\overline{\text{MCLR}}$  pin provides two specific device functions:

- Device Reset
- Device Programming and Debugging.

During device programming and debugging, the resistance and capacitance that can be added to the pin must be considered. Device programmers and debuggers drive the  $\overline{\text{MCLR}}$  pin. Consequently, specific voltage levels ( $V_{IH}$  and  $V_{IL}$ ) and fast signal transitions must not be adversely affected. Therefore, specific values of R and C will need to be adjusted based on the application and PCB requirements.

For example, as shown in Figure 2-2, it is recommended that the capacitor, C, be isolated from the  $\overline{\text{MCLR}}$  pin during programming and debugging operations.

Place the components, as shown in Figure 2-2, within one-quarter inch (6 mm) from the  $\overline{\text{MCLR}}$  pin.

**FIGURE 2-2: EXAMPLE OF  $\overline{\text{MCLR}}$  PIN CONNECTIONS**

## 2.4 ICSP Pins

The PGCx and PGDx pins are used for ICSP and debugging purposes. It is recommended to keep the trace length between the ICSP connector and the ICSP pins on the device as short as possible. If the ICSP connector is expected to experience an ESD event, a series resistor is recommended, with the value in the range of a few tens of Ohms, not to exceed 100 Ohms.

Pull-up resistors, series diodes and capacitors on the PGCx and PGDx pins are not recommended as they will interfere with the programmer/debugger communications to the device. If such discrete components are an application requirement, they should be removed from the circuit during programming and debugging. Alternatively, refer to the AC/DC characteristics and timing requirements information in the respective device Flash programming specification for information on capacitive loading limits and pin Voltage Input High (VIH) and Voltage Input Low (VIL) requirements.

Ensure that the “Communication Channel Select” (i.e., PGCx/PGDx pins) programmed into the device matches the physical connections for the ICSP to MPLAB® debugger tool.

For more information on the MPLAB programmer/debugger connection requirements, refer to the Microchip website.

## 2.5 External Oscillator Pins

When the Primary Oscillator (POSC) circuit is used to connect a crystal oscillator, special care and consideration is required to ensure proper operation. The POSC circuit should be tested across the environmental conditions that the end product is intended to be used. The load capacitors specified in the crystal oscillator data sheet can be used as a starting point, however, the parasitic capacitance from the PCB traces can affect the circuit and the values may need to be altered to ensure proper start-up and operation.

Excessive trace length and other physical interaction can lead to poor signal quality. Poorly tuned oscillator circuits can have reduced amplitude, incorrect frequency (runt pulses), distorted waveforms and long start-up times that may result in unpredictable application behavior, such as instruction misexecution, illegal op code fetch, etc. Ensure that the crystal oscillator circuit is at full amplitude and correct frequency before the system begins to execute code. In planning the application’s routing and I/O assignments, ensure that adjacent port pins, and other signals in close proximity to the oscillator do not have high frequencies, short rise and fall times and other similar noise. For further information on the Primary Oscillator see [Section 9.4 “Internal Fast RC \(FRC\) Oscillator”](#).

# dsPIC33CK64MC105 FAMILY

## 2.6 External Oscillator Layout Guidance

Use best practices during PCB layout to ensure robust start-up and operation. The oscillator circuit should be placed on the same side of the board as the device. Also, place the oscillator circuit close to the respective oscillator pins, not exceeding one-half inch (12 mm) distance between them. The load capacitors should be placed next to the oscillator itself, on the same side of the board. Use a grounded copper pour around the oscillator circuit to isolate from surrounding circuits. The grounded copper pour should be routed directly to the MCU ground. Do not run any signal traces or power traces inside the ground pour. If using a two-sided board, avoid any traces on the other side of the board where the crystal is placed. A suggested layout is shown in [Figure 2-3](#).

For additional information and design guidance on oscillator circuits, please refer to these Microchip Application Notes, available at the Microchip website ([www.microchip.com](http://www.microchip.com)):

- AN943, “*Practical PICmicro® Oscillator Analysis and Design*”
- AN949, “*Making Your Oscillator Work*”
- AN1798, “*Crystal Selection for Low-Power Secondary Oscillator*”

**FIGURE 2-3: SUGGESTED PLACEMENT OF THE OSCILLATOR CIRCUIT**

## 2.7 Oscillator Value Conditions on Device Start-up

If the PLL of the target device is enabled and configured for the device start-up oscillator, the maximum oscillator source frequency must be limited to a certain frequency (see [Section 9.0 “Oscillator with High-Frequency PLL”](#)) to comply with device PLL start-up conditions. This means that if the external oscillator frequency is outside this range, the application must start up in the FRC mode first. The default PLL settings after a POR with an oscillator frequency outside this range will violate the device operating speed.

Once the device powers up, the application firmware can initialize the PLL SFRs, CLKDIV and PLLFBD, to a suitable value, and then perform a clock switch to the Oscillator + PLL clock source. Note that clock switching must be enabled in the device Configuration Word.

## 2.8 Unused I/Os

Unused I/O pins should be configured as outputs and driven to a Logic Low state.

Alternatively, connect a 1k to 10k resistor between V<sub>SS</sub> and unused pins, and drive the output to logic low.

## 2.9 Targeted Applications

- Power Factor Correction (PFC):
  - Interleaved PFC
  - Critical Conduction PFC
  - Bridgeless PFC
- DC/DC Converters:
  - Buck, Boost, Forward, Flyback, Push-Pull
  - Half/Full-Bridge
  - Phase-Shift Full-Bridge
  - Resonant Converters
- DC/AC:
  - Half/Full-Bridge Inverter
  - Resonant Inverter
- Motor Control
  - BLDC
  - PMSM
  - SR
  - ACIM

Examples of typical applications are shown in [Figure 2-4](#) through [Figure 2-6](#).

**FIGURE 2-4: BRUSHED DC MOTOR**

FIGURE 2-6: BLDC MOTOR

## 3.0 CPU

**Note 1:** This data sheet summarizes the features of the dsPIC33CK64MC105 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “**Enhanced CPU**” ([www.microchip.com/DS70005158](http://www.microchip.com/DS70005158)) in the “*dsPIC33/PIC24 Family Reference Manual*”.

**2:** Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The dsPIC33CK64MC105 family CPU has a 16-bit (data) modified Harvard architecture with an enhanced instruction set, including significant support for Digital Signal Processing (DSP). The CPU has a 24-bit instruction word with a variable length opcode field. The Program Counter (PC) is 23 bits wide and addresses up to 4M x 24 bits of user program memory space.

An instruction prefetch mechanism helps maintain throughput and provides predictable execution. Most instructions execute in a single-cycle effective execution rate, with the exception of instructions that change the program flow, the double-word move (MOV.D) instruction, PSV accesses and the table instructions. Overhead-free program loop constructs are supported using the DO and REPEAT instructions, both of which are interruptible at any point.

### 3.1 Registers

The dsPIC33CK64MC105 devices have sixteen, 16-bit Working registers in the programmer’s model. Each of the Working registers can act as a Data, Address or Address Offset register. The 16th Working register (W15) operates as a Software Stack Pointer (SSP) for interrupts and calls.

In addition, the dsPIC33CK64MC105 devices include four Alternate Working register sets, which consist of W0 through W14. The Alternate Working registers can be made persistent to help reduce the saving and restoring of register content during Interrupt Service Routines (ISRs). The Alternate Working registers can be assigned to a specific Interrupt Priority Level (IPL1 through IPL6) by configuring the CTXTx[2:0] bits in the FALTREG Configuration register. The Alternate Working registers can also be accessed manually by using the CTXTSWP instruction. The CCTXI[2:0] and MCTXI[2:0] bits in the CTXTSTAT register can be used to identify the current, and most recent, manually selected Working register sets.

## 3.2 Instruction Set

The instruction set for dsPIC33CK64MC105 devices has two classes of instructions: the MCU class of instructions and the DSP class of instructions. These two instruction classes are seamlessly integrated into the architecture and execute from a single execution unit. The instruction set includes many addressing modes and was designed for optimum C compiler efficiency.

### 3.3 Data Space Addressing

The base Data Space can be addressed as up to 4K words or 8 Kbytes, and is split into two blocks, referred to as X and Y data memory. Each memory block has its own independent Address Generation Unit (AGU). The MCU class of instructions operates solely through the X memory AGU, which accesses the entire memory map as one linear Data Space. Certain DSP instructions operate through the X and Y AGUs to support dual operand reads, which splits the data address space into two parts. The X and Y Data Space boundary is device-specific.

The upper 32 Kbytes of the Data Space memory map can optionally be mapped into Program Space (PS) at any 16K program word boundary. The program-to-Data Space mapping feature, known as Program Space Visibility (PSV), lets any instruction access Program Space as if it were Data Space. Refer to “**Data Memory**” ([www.microchip.com/DS70595](http://www.microchip.com/DS70595)) in the “*dsPIC33/PIC24 Family Reference Manual*” for more details on PSV and table accesses.

On dsPIC33CK64MC105 family devices, overhead-free circular buffers (Modulo Addressing) are supported in both X and Y address spaces. The Modulo Addressing removes the software boundary checking overhead for DSP algorithms. The X AGU Circular Addressing can be used with any of the MCU class of instructions. The X AGU also supports Bit-Reversed Addressing to greatly simplify input or output data re-ordering for radix-2 FFT algorithms.

### 3.4 Addressing Modes

The CPU supports these addressing modes:

- Inherent (no operand)
- Relative
- Literal
- Memory Direct
- Register Direct
- Register Indirect

Each instruction is associated with a predefined addressing mode group, depending upon its functional requirements. As many as six addressing modes are supported for each instruction.

## 3.4.1 PROGRAMMER'S MODEL

The programmer's model for the dsPIC33CK64MC105 family is shown in [Figure 3-2](#). All registers in the programmer's model are memory-mapped and can be manipulated directly by instructions. [Table 3-1](#) lists a description of each register.

In addition to the registers contained in the programmer's model, the dsPIC33CK64MC105 devices contain control registers for Modulo Addressing, Bit-Reversed Addressing and interrupts. These registers are described in subsequent sections of this document.

All registers associated with the programmer's model are memory-mapped, as shown in [Figure 3-2](#).

**TABLE 3-1: PROGRAMMER'S MODEL REGISTER DESCRIPTIONS**

Register(s) Name	Description
W0 through W15 <sup>(1)</sup>	Working Register Array
W0 through W14 <sup>(1)</sup>	Alternate Working Register Array 1
W0 through W14 <sup>(1)</sup>	Alternate Working Register Array 2
W0 through W14 <sup>(1)</sup>	Alternate Working Register Array 3
W0 through W14 <sup>(1)</sup>	Alternate Working Register Array 4
ACCA, ACCB	40-Bit DSP Accumulators (Additional Four Alternate Accumulators)
PC	23-Bit Program Counter
SR	ALU and DSP Engine STATUS Register
SPLIM	Stack Pointer Limit Value Register
TBLPAG	Table Memory Page Address Register
DSRPAG	Extended Data Space (EDS) Read Page Register
RCOUNT	REPEAT Loop Counter Register
DCOUNT	DO Loop Counter Register
DOSTARTH, DOSTARTL <sup>(2)</sup>	DO Loop Start Address Register (High and Low)
DOENDH, DOENDL	DO Loop End Address Register (High and Low)
CORCON	Contains DSP Engine, DO Loop Control and Trap Status bits

**Note 1:** Memory-mapped W0 through W14 represent the value of the register in the currently active CPU context.

**Note 2:** The DOSTARTH and DOSTARTL registers are read-only.

## 3.4.4 ARITHMETIC LOGIC UNIT (ALU)

The dsPIC33CK64MC105 family ALU is 16 bits wide and is capable of addition, subtraction, bit shifts and logic operations. Unless otherwise mentioned, arithmetic operations are two's complement in nature. Depending on the operation, the ALU can affect the values of the Carry (C), Zero (Z), Negative (N), Overflow (OV) and Digit Carry (DC) Status bits in the SR register. The C and DC Status bits operate as Borrow and Digit Borrow bits, respectively, for subtraction operations.

The ALU can perform 8-bit or 16-bit operations, depending on the mode of the instruction that is used. Data for the ALU operation can come from the W register array or data memory, depending on the addressing mode of the instruction. Likewise, output data from the ALU can be written to the W register array or a data memory location.

Refer to the “16-Bit MCU and DSC Programmer’s Reference Manual” ([www.microchip.com/DS70000157](http://www.microchip.com/DS70000157)) for information on the SR bits affected by each instruction.

The core CPU incorporates hardware support for both multiplication and division. This includes a dedicated hardware multiplier and support hardware for 16-bit divisor division.

### 3.4.4.1 Multiplier

Using the high-speed, 17-bit x 17-bit multiplier, the ALU supports unsigned, signed or mixed-sign operation in several MCU multiplication modes:

- 16-bit x 16-bit signed
- 16-bit x 16-bit unsigned
- 16-bit signed x 5-bit (literal) unsigned
- 16-bit signed x 16-bit unsigned
- 16-bit unsigned x 5-bit (literal) unsigned
- 16-bit unsigned x 16-bit signed
- 8-bit unsigned x 8-bit unsigned

### 3.4.4.2 Divider

The divide block supports 32-bit/16-bit and 16-bit/16-bit signed and unsigned integer divide operations with the following data sizes:

- 32-bit signed/16-bit signed divide
- 32-bit unsigned/16-bit unsigned divide
- 16-bit signed/16-bit signed divide
- 16-bit unsigned/16-bit unsigned divide

The 16-bit signed and unsigned `DIV` instructions can specify any W register for both the 16-bit divisor (`Wn`) and any W register (aligned) pair (`W(m + 1):Wm`) for the 32-bit dividend. The divide algorithm takes one cycle per bit of divisor, so both 32-bit/16-bit and 16-bit/16-bit instructions take the same number of cycles to execute. There are additional instructions: `DIV2` and `DIVF2`. Divide instructions will complete in six cycles.

## 3.4.5 DSP ENGINE

The DSP engine consists of a high-speed 17-bit x 17-bit multiplier, a 40-bit barrel shifter and a 40-bit adder/subtractor (with two target accumulators, round and saturation logic).

The DSP engine can also perform inherent accumulator-to-accumulator operations that require no additional data. These instructions are, `ADD`, `SUB`, `NEG`, `MIN` and `MAX`.

The DSP engine has options selected through bits in the CPU Core Control register (`CORCON`), as listed below:

- Fractional or integer DSP multiply (`IF`)
- Signed, unsigned or mixed-sign DSP multiply (`USx`)
- Conventional or convergent rounding (`RND`)
- Automatic saturation on/off for `ACCA` (`SATA`)
- Automatic saturation on/off for `ACCB` (`SATB`)
- Automatic saturation on/off for writes to data memory (`SATDW`)
- Accumulator Saturation mode selection (`ACCSAT`)

**TABLE 3-2: DSP INSTRUCTIONS SUMMARY**

Instruction	Algebraic Operation	ACC Write-Back
CLR	$A = 0$	Yes
ED	$A = (x - y)^2$	No
EDAC	$A = A + (x - y)^2$	No
MAC	$A = A + (x \cdot y)$	Yes

NOTES:

# dsPIC33CK64MC105 FAMILY

## 4.0 MEMORY ORGANIZATION

**Note:** This data sheet summarizes the features of the dsPIC33CK64MC105 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “dsPIC33/PIC24 Program Memory” ([www.microchip.com/DS70000613](http://www.microchip.com/DS70000613)) in the “dsPIC33/PIC24 Family Reference Manual”.

The dsPIC33CK64MC105 family architecture features separate program and data memory spaces, and buses. This architecture also allows the direct access of program memory from the Data Space (DS) during code execution.

## 4.1 Program Address Space

The program address memory space of the dsPIC33CK64MC105 family devices is 4M instructions. The space is addressable by a 24-bit value derived either from the 23-bit PC during program execution, or from table operation or Data Space remapping, as described in [Section 4.5.5 “Interfacing Program and Data Memory Spaces”](#).

User application access to the program memory space is restricted to the lower half of the address range (0x000000 to 0x7FFFFFFF). The exception is the use of TBLRD operations, which use TBLPAG[7] to permit access to calibration data and Device ID sections of the configuration memory space.

The program memory maps for dsPIC33CK64MC105 devices are shown in [Figure 4-1](#) through [Figure 4-3](#).

**FIGURE 4-1: PROGRAM MEMORY MAP FOR dsPIC33CK32MC10X DEVICES<sup>(1)</sup>**

# dsPIC33CK64MC105 FAMILY

FIGURE 4-3: CODE MEMORY MAP FOR dsPIC33CK32MC10X DEVICES<sup>(1)</sup>

# dsPIC33CK64MC105 FAMILY

## 4.1.1 PROGRAM MEMORY ORGANIZATION

The program memory space is organized in word-addressable blocks. Although it is treated as 24 bits wide, it is more appropriate to think of each address of the program memory as a lower and upper word, with the upper byte of the upper word being unimplemented. The lower word always has an even address, while the upper word has an odd address (Figure 4-4).

Program memory addresses are always word-aligned on the lower word, and addresses are incremented or decremented, by two, during code execution. This arrangement provides compatibility with data memory space addressing and makes data in the program memory space accessible.

## 4.1.2 INTERRUPT AND TRAP VECTORS

All dsPIC33CK64MC105 family devices reserve the addresses between 0x000000 and 0x000200 for hard-coded program execution vectors. A hardware Reset vector is provided to redirect code execution from the default value of the PC on device Reset to the actual start of code. A GOTO instruction is programmed by the user application at address, 0x000000, of Flash memory, with the actual address for the start of code at address, 0x000002, of Flash memory.

A more detailed discussion of the Interrupt Vector Tables (IVTs) is provided in Section 7.0 “Interrupt Controller”.

**FIGURE 4-4: PROGRAM MEMORY ORGANIZATION**

# dsPIC33CK64MC105 FAMILY

## 4.1.3 UNIQUE DEVICE IDENTIFIER (UDID)

All dsPIC33CK64MC105 family devices are individually encoded during final manufacturing with a Unique Device Identifier or UDID. The UDID cannot be erased by a bulk erase command or any other user-accessible means. This feature allows for manufacturing traceability of Microchip Technology devices in applications where this is a requirement. It may also be used by the application manufacturer for any number of things that may require unique identification, such as:

- Tracking the device
- Unique serial number
- Unique security key

The UDID comprises five 24-bit program words. When taken together, these fields form a unique 120-bit identifier.

The UDID is stored in five read-only locations, located between 0x801200 and 0x801208 in the device configuration space. Table 4-1 lists the addresses of the identifier words and shows their contents.

**TABLE 4-1: UDID ADDRESSES**

UDID	Address	Description
UDID1	0x801200	UDID Word 1
UDID2	0x801202	UDID Word 2
UDID3	0x801204	UDID Word 3
UDID4	0x801206	UDID Word 4
UDID5	0x801208	UDID Word 5

## 4.2 Data Address Space

The dsPIC33CK64MC105 family CPU has a separate 16-bit wide data memory space. The Data Space is accessed using separate Address Generation Units (AGUs) for read and write operations. The data memory map is shown in Figure 4-5.

All Effective Addresses (EAs) in the data memory space are 16 bits wide and point to bytes within the Data Space. This arrangement gives a base Data Space address range of 64 Kbytes or 32K words.

The lower half of the data memory space (i.e., when EA[15] = 0) is used for implemented memory addresses, while the upper half (EA[15] = 1) is reserved for the Program Space Visibility (PSV).

The dsPIC33CK64MC105 family devices implement up to 16 Kbytes of data memory. If an EA points to a location outside of this area, an all-zero word or byte is returned.

## 4.2.1 DATA SPACE WIDTH

The data memory space is organized in byte-addressable, 16-bit wide blocks. Data are aligned in data memory and registers as 16-bit words, but all Data Space EAs resolve to bytes. The Least Significant Bytes (LSBs) of each word have even addresses, while the Most Significant Bytes (MSBs) have odd addresses.

## 4.2.2 DATA MEMORY ORGANIZATION AND ALIGNMENT

To maintain backward compatibility with PIC<sup>®</sup> MCU devices and improve Data Space memory usage efficiency, the dsPIC33CK64MC105 family instruction set supports both word and byte operations. As a consequence of byte accessibility, all Effective Address calculations are internally scaled to step through word-aligned memory. For example, the core recognizes that Post-Modified Register Indirect Addressing mode [Ws++] results in a value of Ws + 1 for byte operations and Ws + 2 for word operations.

A data byte read, reads the complete word that contains the byte, using the LSb of any EA to determine which byte to select. The selected byte is placed onto the LSB of the data path. That is, data memory and registers are organized as two parallel, byte-wide entities with shared (word) address decode, but separate write lines. Data byte writes only write to the corresponding side of the array or register that matches the byte address.

All word accesses must be aligned to an even address. Misaligned word data fetches are not supported, so care must be taken when mixing byte and word operations, or translating from 8-bit MCU code. If a misaligned read or write is attempted, an address error trap is generated. If the error occurred on a read, the instruction underway is completed. If the error occurred on a write, the instruction is executed but the write does not occur. In either case, a trap is then executed, allowing the system and/or user application to examine the machine state prior to execution of the address Fault.

All byte loads into any W register are loaded into the LSB; the MSB is not modified.

A Sign-Extend (SE) instruction is provided to allow user applications to translate 8-bit signed data to 16-bit signed values. Alternatively, for 16-bit unsigned data, user applications can clear the MSB of any W register by executing a Zero-Extend (ZE) instruction on the appropriate address.

# dsPIC33CK64MC105 FAMILY

---

## 4.2.3 SFR SPACE

The first 4 Kbytes of the Near Data Space, from 0x0000 to 0x0FFF, is primarily occupied by Special Function Registers (SFRs). These are used by the dsPIC33CK64MC105 family core and peripheral modules for controlling the operation of the device.

SFRs are distributed among the modules that they control and are generally grouped together by module. Much of the SFR space contains unused addresses; these are read as '0'.

<p><b>Note:</b> The actual set of peripheral features and interrupts varies by the device. Refer to the corresponding device tables and pinout diagrams for device-specific information.</p>
--

## 4.2.4 NEAR DATA SPACE

The 8-Kbyte area, between 0x0000 and 0x1FFF, is referred to as the Near Data Space. Locations in this space are directly addressable through a 13-bit absolute address field within all memory direct instructions. Additionally, the whole Data Space is addressable using *MOV* instructions, which support Memory Direct Addressing mode with a 16-bit address field, or by using Indirect Addressing mode using a Working register as an Address Pointer.

# dsPIC33CK64MC105 FAMILY

**FIGURE 4-5: DATA MEMORY MAP FOR dsPIC33CK64MCX0X AND dsPIC33CK32MCX0X DEVICES**

## 4.2.5 X AND Y DATA SPACES

The dsPIC33CK64MC105 family core has two Data Spaces: X and Y. These Data Spaces can be considered either separate (for some DSP instructions) or as one unified linear address range (for MCU instructions). The Data Spaces are accessed using two Address Generation Units (AGUs) and separate data paths. This feature allows certain instructions to concurrently fetch two words from RAM, thereby enabling efficient execution of DSP algorithms, such as Finite Impulse Response (FIR) filtering and Fast Fourier Transform (FFT).

The X Data Space is used by all instructions and supports all addressing modes. X Data Space has separate read and write data buses. The X read data bus is the read data path for all instructions that view Data Space as combined X and Y address space. It is also the X data prefetch path for the dual operand DSP instructions (MAC class).

The Y Data Space is used in concert with the X Data Space by the MAC class of instructions (CLR, ED, EDAC, MAC, MOV SAC, MPY, MPY.N and MSC) to provide two concurrent data read paths.

Both the X and Y Data Spaces support Modulo Addressing mode for all instructions, subject to addressing mode restrictions. Bit-Reversed Addressing mode is only supported for writes to X Data Space.

All data memory writes, including in DSP instructions, view Data Space as combined X and Y address space. The boundary between the X and Y Data Spaces is device-dependent and is not user-programmable.

## 4.3 BIST Overview

The dsPIC33CK64MC105 family features a data memory Built-In Self-Test (BIST) that has the option to be run at start-up or run time. The memory test checks that all memory locations are functional and provides a pass/fail status of the RAM that can be used by software to take action if needed. If a failure is reported, the specific location(s) are not identified.

The MBISTCON register ([Register 4-1](#)) contains control and status bits for BIST operation. The MBISTDONE bit (MBISTCON[7]) indicates if a BIST was run since the last Reset and the MBISTSTAT bit (MBISTCON[4]) provides the pass/fail result.

The BIST feature operates with a clock of FRC+PLL with PLL settings forced by hardware to result in a 125 MHz clock rate, at both start-up and run time.

### 4.3.1 BIST AT START-UP

The BIST can be configured to automatically run on a POR-type Reset, as shown in [Figure 4-6](#). By default, when BISTDIS (FPOR[6]) = 1, the BIST is disabled and will not be part of device start-up. If the BISTDIS bit is cleared during device programming, the BIST will run after all Configuration registers have been loaded and before code execution begins.

FIGURE 4-6: BIST FLOWCHART

### 4.3.2 BIST AT RUN TIME

A BIST test can be requested to run on subsequent device Resets at any time.

A BIST will corrupt all of the RAM contents, including the Stack Pointer, and requires a subsequent Reset. The system should be prepared for a Reset before a BIST is performed. The BIST is invoked by setting the MBISTEN bit (MBISTCON[0]) and executing a Reset. The MBISTCON register is protected against accidental writes and requires an unlock sequence prior to writing. Only one bit can be set per unlock sequence. The procedure for a run-time BIST is as follows:

1. Execute the unlock sequence by consecutively writing 0x55 and 0xAA to the NVMKEY register.
2. Write 0x0001 to the MBISTCON SFR.
3. Execute a software RESET command.
4. Verify a Software Reset has occurred by reading SWR (RCON[6]) (optional).
5. Verify that the MBISTDONE bit is set.
6. Take action depending on test result indicated by MBISTSTAT.

# dsPIC33CK64MC105 FAMILY

## 4.3.3 FAULT SIMULATION

A mechanism is available to simulate a BIST failure to allow testing of Fault handling software. When the FLTINJ bit is set during a run-time BIST, the MBISTSTAT bit will be set regardless of the test result. The procedure for a BIST Fault simulation is as follows:

1. Execute the unlock sequence by consecutively writing 0x55 and 0xAA to the NVMKEY register.
2. Set the MBISTEN bit (MBISTCON[0]).
3. Execute 2nd unlock sequence by consecutively writing 0x55 and 0xAA to the NVMKEY register.
4. Set the FLTINJ bit (MBISTCON[8]).
5. Execute a software `RESET` command.
6. Verify the MBISTDONE, MBISTSTAT and FLTINJ bits are all set.

bit 15							bit 8

R/W/HS-0 <sup>(1)</sup>	U-0	U-0	R-0	U-0	U-0	U-0	R/W/HC-0 <sup>(2)</sup>
MBISTDONE	—	—	MBISTSTAT	—	—	—	MBISTEN
bit 7							bit 0

<b>Legend:</b>	HS = Hardware Settable bit	HC = Hardware Clearable bit
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared      x = Bit is unknown

- bit 15-9      **Unimplemented:** Read as '0'
- bit 8        **FLTINJ:** MBIST Fault Inject Control bit<sup>(1)</sup>
  - 1 = The MBIST test will complete and sets MBISTSTAT = 1, simulating an SRAM test failure
  - 0 = The MBIST test will execute normally
- bit 7        **MBISTDONE:** MBIST Done Status bit<sup>(1)</sup>
  - 1 = An MBIST operation has been executed
  - 0 = No MBIST operation has occurred on the last Reset sequence
- bit 6-5      **Unimplemented:** Read as '0'
- bit 4        **MBISTSTAT:** MBIST Status bit
  - 1 = The last MBIST failed
  - 0 = The last MBIST passed; all memory may not have been tested
- bit 3-1      **Unimplemented:** Read as '0'
- bit 0        **MBISTEN:** MBIST Enable bit<sup>(2)</sup>
  - 1 = MBIST test is armed; an MBIST test will execute at the next device Reset
  - 0 = MBIST test is disarmed

- Note 1:** HW resets only on a true POR Reset.  
**Note 2:** This bit will self-clear when the MBIST test is complete.

# dsPIC33CK64MC105 FAMILY

## 4.4 Memory Resources

Many useful resources are provided on the main product page of the Microchip website for the devices listed in this data sheet. This product page contains the latest updates and additional information.

### 4.4.1 KEY RESOURCES

- “dsPIC33/PIC24 Program Memory” ([www.microchip.com/DS70000613](http://www.microchip.com/DS70000613)) in the “dsPIC33/PIC24 Family Reference Manual”
- Code Samples
- Application Notes
- Software Libraries

- Webinars
- All Related “dsPIC33/PIC24 Family Reference Manual” Sections
- Development Tools

## 4.5 SFR Maps

The following tables show the dsPIC33CK64MC105 family SFR names, addresses and Reset values. These tables contain all registers applicable to the dsPIC33CK64MC105 family. Not all registers are present on all device variants. Refer to [Table 1](#) and [Table 2](#) for peripheral availability. [Table 8-1](#) details port availability for the different package options.

## 4.5.1 PAGED MEMORY SCHEME

The dsPIC33CK64MC105 architecture extends the available Data Space through a paging scheme, which allows the available Data Space to be accessed using MOV instructions in a linear fashion for pre- and post-modified Effective Addresses (EAs). The upper half of the base Data Space address is used in conjunction with the Data Space Read Page (DSRPAG) register to form the Program Space Visibility (PSV) address.

The Data Space Read Page (DSRPAG) register is located in the SFR space. Construction of the PSV address is shown in Figure 4-7. When DSRPAG[9] = 1 and the base address bit, EA[15] = 1, the DSRPAG[8:0] bits are concatenated onto EA[14:0] to form the 24-bit PSV read address.

The paged memory scheme provides access to multiple 32-Kbyte windows in the PSV memory. The Data Space Read Page (DSRPAG) register, in combination with the upper half of the Data Space address, can provide up to 8 Mbytes of PSV address space. The paged data memory space is shown in Figure 4-8.

The Program Space (PS) can be accessed with a DSRPAG of 0x200 or greater. Only reads from PS are supported using the DSRPAG.

**FIGURE 4-7: PROGRAM SPACE VISIBILITY (PSV) READ ADDRESS GENERATION**

**FIGURE 4-8: PAGED DATA MEMORY SPACE**

# dsPIC33CK64MC105 FAMILY

When a PSV page overflow or underflow occurs, EA[15] is cleared as a result of the register indirect EA calculation. An overflow or underflow of the EA in the PSV pages can occur at the page boundaries when:

- The initial address, prior to modification, addresses the PSV page
- The EA calculation uses Pre- or Post-Modified Register Indirect Addressing; however, this does not include Register Offset Addressing

In general, when an overflow is detected, the DSRPAG register is incremented and the EA[15] bit is set to keep the base address within the PSV window. When an underflow is detected, the DSRPAG register is decremented and the EA[15] bit is set to keep the base

address within the PSV window. This creates a linear PSV address space, but only when using Register Indirect Addressing modes.

Exceptions to the operation described above arise when entering and exiting the boundaries of Page 0 and PSV spaces. [Table 4-14](#) lists the effects of overflow and underflow scenarios at different boundaries.

In the following cases, when overflow or underflow occurs, the EA[15] bit is set and the DSRPAG is not modified; therefore, the EA will wrap to the beginning of the current page:

- Register Indirect with Register Offset Addressing
- Modulo Addressing
- Bit-Reversed Addressing

**TABLE 4-14: OVERFLOW AND UNDERFLOW SCENARIOS AT PAGE 0 AND PSV SPACE BOUNDARIES<sup>(2,3,4)</sup>**

O/U, R/W	Operation	Before			After		
		DSRPAG	DS EA[15]	Page Description	DSRPAG	DS EA[15]	Page Description
O, Read	[++Wn] or [Wn++]	DSRPAG = 0x2FF	1	PSV: Last lsw page	DSRPAG = 0x300	1	PSV: First MSB page
O, Read	[Wn++]	DSRPAG = 0x3FF	1	PSV: Last MSB page	DSRPAG = 0x3FF	0	See <a href="#">Note 1</a>
U, Read	[--Wn] or [Wn--]	DSRPAG = 0x001	1	PSV page	DSRPAG = 0x001	0	See <a href="#">Note 1</a>
U, Read	[--Wn] or [Wn--]	DSRPAG = 0x200	1	PSV: First lsw page	DSRPAG = 0x200	0	See <a href="#">Note 1</a>
U, Read	[Wn--]	DSRPAG = 0x300	1	PSV: First MSB page	DSRPAG = 0x2FF	1	PSV: Last lsw page

**Legend:** O = Overflow, U = Underflow, R = Read, W = Write

**Note 1:** The Register Indirect Addressing now addresses a location in the base Data Space (0x0000-0x8000).

**2:** An EDS access, with DSRPAG = 0x000, will generate an address error trap.

**3:** Only reads from PS are supported using DSRPAG.

**4:** Pseudolinear Addressing is not supported for large offsets.

# dsPIC33CK64MC105 FAMILY

## 4.5.1.1 Extended X Data Space

The lower portion of the base address space range, between 0x0000 and 0x7FFF, is always accessible, regardless of the contents of the Data Space Read Page register. It is indirectly addressable through the register indirect instructions. It can be regarded as being located in the default EDS Page 0 (i.e., EDS address range of 0x000000 to 0x007FFF with the base address bit, EA[15] = 0, for this address range). However, Page 0 cannot be accessed through the upper 32 Kbytes, 0x8000 to 0xFFFF, of base Data Space in combination with DSRPAG = 0x00. Consequently, DSRPAG is initialized to 0x001 at Reset.

**Note 1:** DSRPAG should not be used to access Page 0. An EDS access with DSRPAG set to 0x000 will generate an address error trap.

**2:** Clearing the DSRPAG in software has no effect.

The remaining PSV pages are only accessible using the DSRPAG register in combination with the upper 32 Kbytes, 0x8000 to 0xFFFF, of the base address, where the base address bit, EA[15] = 1.

## 4.5.1.2 Software Stack

The W15 register serves as a dedicated Software Stack Pointer (SSP), and is automatically modified by exception processing, subroutine calls and returns; however, W15 can be referenced by any instruction in the same manner as all other W registers. This simplifies reading, writing and manipulating the Stack Pointer (for example, creating stack frames).

**Note:** To protect against misaligned stack accesses, W15[0] is fixed to '0' by the hardware.

W15 is initialized to 0x1000 during all Resets. This address ensures that the SSP points to valid RAM in all dsPIC33CK64MC105 devices and permits stack availability for non-maskable trap exceptions. These can occur before the SSP is initialized by the user software. You can reprogram the SSP during initialization to any location within Data Space.

The Software Stack Pointer always points to the first available free word and fills the software stack, working from lower toward higher addresses. Figure 4-9 illustrates how it pre-decrements for a stack pop (read) and post-increments for a stack push (writes).

When the PC is pushed onto the stack, PC[15:0] are pushed onto the first available stack word, then PC[22:16] are pushed into the second available stack location. For a PC push during any CALL instruction, the MSB of the PC is zero-extended before the push, as shown in Figure 4-9. During exception processing, the MSB of the PC is concatenated with the lower eight bits of the CPU STATUS Register, SR. This allows the contents of SRL to be preserved automatically during interrupt processing.

**Note 1:** To maintain system Stack Pointer (W15) coherency, W15 is never subject to (EDS) paging, and is therefore, restricted to an address range of 0x0000 to 0xFFFF. The same applies to the W14 when used as a Stack Frame Pointer (SFA = 1).

**2:** As the stack can be placed in, and can access X and Y spaces, care must be taken regarding its use, particularly with regard to local automatic variables in a C development environment

FIGURE 4-9: CALL STACK FRAME

# dsPIC33CK64MC105 FAMILY

## 4.5.2 INSTRUCTION ADDRESSING MODES

The addressing modes shown in [Table 4-15](#) form the basis of the addressing modes optimized to support the specific features of individual instructions. The addressing modes provided in the *MAC* class of instructions differ from those in the other instruction types.

### 4.5.2.1 File Register Instructions

Most file register instructions use a 13-bit address field (*f*) to directly address data present in the first 8192 bytes of data memory (Near Data Space). Most file register instructions employ a Working register, *W0*, which is denoted as *WREG* in these instructions. The destination is typically either the same file register or *WREG* (with the exception of the *MUL* instruction), which writes the result to a register or register pair. The *MOV* instruction allows additional flexibility and can access the entire Data Space.

### 4.5.2.2 MCU Instructions

The three-operand MCU instructions are of the form:

Operand 3 = Operand 1 <function> Operand 2

where *Operand 1* is always a Working register (that is, the addressing mode can only be Register Direct), which is referred to as *Wb*. *Operand 2* can be a *W* register fetched from data memory or a 5-bit literal. The result location can either be a *W* register or a data memory location. The following addressing modes are supported by MCU instructions:

- Register Direct
- Register Indirect
- Register Indirect Post-Modified
- Register Indirect Pre-Modified
- 5-Bit or 10-Bit Literal

**Note:** Not all instructions support all the addressing modes given above. Individual instructions can support different subsets of these addressing modes.

**TABLE 4-15: FUNDAMENTAL ADDRESSING MODES SUPPORTED**

Addressing Mode	Description
File Register Direct	The address of the file register is specified explicitly.
Register Direct	The contents of a register are accessed directly.
Register Indirect	The contents of <i>Wn</i> form the Effective Address (EA).
Register Indirect Post-Modified	The contents of <i>Wn</i> form the EA. <i>Wn</i> is post-modified (incremented or decremented) by a constant value.
Register Indirect Pre-Modified	<i>Wn</i> is pre-modified (incremented or decremented) by a signed constant value to form the EA.
Register Indirect with Register Offset (Register Indexed)	The sum of <i>Wn</i> and <i>Wb</i> forms the EA.
Register Indirect with Literal Offset	The sum of <i>Wn</i> and a literal forms the EA.

# dsPIC33CK64MC105 FAMILY

---

## 4.5.2.3 Move and Accumulator Instructions

Move instructions, and the DSP accumulator class of instructions, provide a greater degree of addressing flexibility than other instructions. In addition to the addressing modes supported by most MCU instructions, move and accumulator instructions also support Register Indirect with Register Offset Addressing mode, also referred to as Register Indexed mode.

**Note:** For the `MOV` instructions, the addressing mode specified in the instruction can differ for the source and destination EA. However, the 4-bit `Wb` (Register Offset) field is shared by both source and destination (but typically only used by one).

In summary, the following addressing modes are supported by move and accumulator instructions:

- Register Direct
- Register Indirect
- Register Indirect Post-Modified
- Register Indirect Pre-Modified
- Register Indirect with Register Offset (Indexed)
- Register Indirect with Literal Offset
- 8-Bit Literal
- 16-Bit Literal

**Note:** Not all instructions support all the addressing modes given above. Individual instructions may support different subsets of these addressing modes.

## 4.5.2.4 MAC Instructions

The dual source operand DSP instructions (`CLR`, `ED`, `EDAC`, `MAC`, `MPY`, `MPY.N`, `MOVSAC` and `MSC`), also referred to as `MAC` instructions, use a simplified set of addressing modes to allow the user application to effectively manipulate the Data Pointers through register indirect tables.

The two-source operand prefetch registers must be members of the set {`W8`, `W9`, `W10`, `W11`}. For data reads, `W8` and `W9` are always directed to the X RAGU, and `W10` and `W11` are always directed to the Y AGU. The Effective Addresses generated (before and after modification) must therefore, be valid addresses within X Data Space for `W8` and `W9`, and Y Data Space for `W10` and `W11`.

**Note:** Register Indirect with Register Offset Addressing mode is available only for `W9` (in X space) and `W11` (in Y space).

In summary, the following addressing modes are supported by the `MAC` class of instructions:

- Register Indirect
- Register Indirect Post-Modified by 2
- Register Indirect Post-Modified by 4
- Register Indirect Post-Modified by 6
- Register Indirect with Register Offset (Indexed)

## 4.5.2.5 Other Instructions

Besides the addressing modes outlined previously, some instructions use literal constants of various sizes. For example, `BRA` (branch) instructions use 16-bit signed literals to specify the branch destination directly, whereas the `DISI` instruction uses a 14-bit unsigned literal field. In some instructions, such as `ULNK`, the source of an operand or result is implied by the opcode itself. Certain operations, such as a `NOP`, do not have any operands.

## 4.5.3 MODULO ADDRESSING

Modulo Addressing mode is a method of providing an automated means to support circular data buffers using hardware. The objective is to remove the need for software to perform data address boundary checks when executing tightly looped code, as is typical in many DSP algorithms.

Modulo Addressing can operate in either Data or Program Space (since the Data Pointer mechanism is essentially the same for both). One circular buffer can be supported in each of the X (which also provides the pointers into Program Space) and Y Data Spaces. Modulo Addressing can operate on any W Register Pointer. However, it is not advisable to use W14 or W15 for Modulo Addressing since these two registers are used as the Stack Frame Pointer and Stack Pointer, respectively.

In general, any particular circular buffer can be configured to operate in only one direction, as there are certain restrictions on the buffer start address (for incrementing buffers) or end address (for decrementing buffers), based upon the direction of the buffer.

The only exception to the usage restrictions is for buffers that have a power-of-two length. As these buffers satisfy the start and end address criteria, they can operate in a Bidirectional mode (that is, address boundary checks are performed on both the lower and upper address boundaries).

### 4.5.3.1 Start and End Address

The Modulo Addressing scheme requires that a starting and ending address be specified and loaded into the 16-bit Modulo Buffer Address registers: XMODSRT, XMODEND, YMODSRT and YMODEND (see Table 4-2).

**Note:** Y space Modulo Addressing EA calculations assume word-sized data (LSb of every EA is always clear).

The length of a circular buffer is not directly specified. It is determined by the difference between the corresponding start and end addresses. The maximum possible length of the circular buffer is 32K words (64 Kbytes).

### 4.5.3.2 W Address Register Selection

The Modulo and Bit-Reversed Addressing Control register, MODCON[15:0], contains enable flags, as well as a W register field to specify the W Address registers. The XWM and YWM fields select the registers that operate with Modulo Addressing:

- If XWM = 1111, X RAGU and X WAGU Modulo Addressing is disabled
- If YWM = 1111, Y AGU Modulo Addressing is disabled

The X Address Space Pointer W (XWM) register, to which Modulo Addressing is to be applied, is stored in MODCON[3:0] (see Table 4-2). Modulo Addressing is enabled for X Data Space when XWM is set to any value other than '1111' and the XMODEN bit is set (MODCON[15]).

The Y Address Space Pointer W (YWM) register, to which Modulo Addressing is to be applied, is stored in MODCON[7:4]. Modulo Addressing is enabled for Y Data Space when YWM is set to any value other than '1111' and the YMODEN bit (MODCON[14]) is set.

**FIGURE 4-10: MODULO ADDRESSING OPERATION EXAMPLE**

# dsPIC33CK64MC105 FAMILY

---

## 4.5.3.3 Modulo Addressing Applicability

Modulo Addressing can be applied to the Effective Address (EA) calculation associated with any W register. Address boundaries check for addresses equal to:

- The upper boundary addresses for incrementing buffers
- The lower boundary addresses for decrementing buffers

It is important to realize that the address boundaries check for addresses less than, or greater than, the upper (for incrementing buffers) and lower (for decrementing buffers) boundary addresses (not just equal to). Address changes can, therefore, jump beyond boundaries and still be adjusted correctly.

**Note:** The modulo corrected Effective Address is written back to the register only when Pre-Modify or Post-Modify Addressing mode is used to compute the Effective Address. When an address offset (such as  $[W7 + W2]$ ) is used, Modulo Addressing correction is performed, but the contents of the register remain unchanged.

## 4.5.4 BIT-REVERSED ADDRESSING

Bit-Reversed Addressing mode is intended to simplify data reordering for radix-2 FFT algorithms. It is supported by the X AGU for data writes only.

The modifier, which can be a constant value or register contents, is regarded as having its bit order reversed. The address source and destination are kept in normal order. Thus, the only operand requiring reversal is the modifier.

## 4.5.4.1 Bit-Reversed Addressing Implementation

Bit-Reversed Addressing mode is enabled in any of these situations:

- BWMx bits (W register selection) in the MODCON register are any value other than '1111' (the stack cannot be accessed using Bit-Reversed Addressing)
- The BREN bit is set in the XBREV register
- The addressing mode used is Register Indirect with Pre-Increment or Post-Increment

If the length of a bit-reversed buffer is  $M = 2^N$  bytes, the last 'N' bits of the data buffer start address must be zeros.

XB[14:0] is the Bit-Reversed Addressing modifier, or 'pivot point', which is typically a constant. In the case of an FFT computation, its value is equal to half of the FFT data buffer size.

**Note:** All bit-reversed EA calculations assume word-sized data (LSb of every EA is always clear). The XB value is scaled accordingly to generate compatible (byte) addresses.

When enabled, Bit-Reversed Addressing is executed only for Register Indirect with Pre-Increment or Post-Increment Addressing and word-sized data writes. It does not function for any other addressing mode or for byte-sized data and normal addresses are generated instead. When Bit-Reversed Addressing is active, the W Address Pointer is always added to the address modifier (XB) and the offset associated with the Register Indirect Addressing mode is ignored. In addition, as word-sized data are a requirement, the LSb of the EA is ignored (and always clear).

**Note:** Modulo Addressing and Bit-Reversed Addressing can be enabled simultaneously using the same W register, but Bit-Reversed Addressing operation will always take precedence for data writes when enabled.

If Bit-Reversed Addressing has already been enabled by setting the BREN (XBREV[15]) bit, a write to the XBREV register should not be immediately followed by an indirect read operation using the W register that has been designated as the Bit-Reversed Pointer.

# dsPIC33CK64MC105 FAMILY

## 4.5.5 INTERFACING PROGRAM AND DATA MEMORY SPACES

The dsPIC33CK64MC105 family architecture uses a 24-bit wide Program Space (PS) and a 16-bit wide Data Space (DS). The architecture is also a modified Harvard scheme, meaning that data can also be present in the Program Space. To use these data successfully, they must be accessed in a way that preserves the alignment of information in both spaces.

Aside from normal execution, the architecture of the dsPIC33CK64MC105 family devices provides two methods by which Program Space can be accessed during operation:

- Using table instructions to access individual bytes or words anywhere in the Program Space
- Remapping a portion of the Program Space into the Data Space (Program Space Visibility)

Table instructions allow an application to read small areas of the program memory. This capability makes the method ideal for accessing data tables that need to be updated periodically. It also allows access to all bytes of the program word. The remapping method allows an application to access a large block of data on a read-only basis, which is ideal for look-ups from a large table of static data. The application can only access the least significant word of the program word.

**TABLE 4-17: PROGRAM SPACE ADDRESS CONSTRUCTION**

Access Type	Access Space	Program Space Address				
		[23]	[22:16]	[15]	[14:1]	[0]
Instruction Access (Code Execution)	User	0	PC[22:1]			0
		0xxx xxxx xxxxx xxxxx xxxxx xxx0				
TBLRD (Byte/Word Read)	User	TBLPAG[7:0]		Data EA[15:0]		
		0xxx xxxxx xxxxx xxxxx xxxxx xxxxx				
	Configuration	TBLPAG[7:0]		Data EA[15:0]		
		1xxx xxxxx xxxxx xxxxx xxxxx xxxxx				

**FIGURE 4-12: DATA ACCESS FROM PROGRAM SPACE ADDRESS GENERATION**

## 4.5.5.1 Data Access from Program Memory Using Table Instructions

The `TBLRDH` instruction offers a direct method of reading the lower word of any address within the Program Space without going through Data Space. The `TBLRDH` instruction is the only method to read the upper eight bits of a Program Space word as data.

This allows program memory addresses to directly map to Data Space addresses. Program memory can thus be regarded as two 16-bit wide word address spaces, residing side by side, each with the same address range. `TBLRDH` accesses the space that contains the least significant data word. `TBLRDH` accesses the space that contains the upper data byte.

Two table instructions are provided to read byte or word-sized (16-bit) data from Program Space. Both function as either byte or word operations.

- `TBLRDH` (Table Read High):
  - In Word mode, this instruction maps the entire upper word of a program address (`P[23:16]`) to a data address. The 'phantom' byte (`D[15:8]`) is always '0'.
  - In Byte mode, this instruction maps the upper or lower byte of the program word to `D[7:0]` of the data address in the `TBLRDH` instruction. The data are always '0' when the upper 'phantom' byte is selected (Byte Select = 1).
- `TBLRDH` (Table Read Low):
  - In Word mode, this instruction maps the lower word of the Program Space location (`P[15:0]`) to a data address (`D[15:0]`)
  - In Byte mode, either the upper or lower byte of the lower program word is mapped to the lower byte of a data address. The upper byte is selected when Byte Select is '1'; the lower byte is selected when it is '0'.

NOTES:

## 5.0 FLASH PROGRAM MEMORY

**Note 1:** This data sheet summarizes the features of the dsPIC33CK64MC105 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “Flash Programming” ([www.microchip.com/DS70000609](http://www.microchip.com/DS70000609)) in the “dsPIC33/PIC24 Family Reference Manual”.

The dsPIC33CK64MC105 family devices contain internal Flash program memory for storing and executing application code. The memory is readable, writable and erasable during normal operation over the entire VDD range.

Flash memory can be programmed in three ways:

- In-Circuit Serial Programming™ (ICSP™) programming capability
- Enhanced In-Circuit Serial Programming (Enhanced ICSP)
- Run-Time Self-Programming (RTSP)

ICSP allows for a dsPIC33CK64MC105 family device to be serially programmed while in the end application circuit. This is done with a Programming Clock and Programming Data (PGCx/PGDx) line, and three other lines for power (VDD), ground (VSS) and Master Clear (MCLR). This allows customers to manufacture boards with unprogrammed devices and then program the device just before shipping the product. This also allows the most recent firmware or a custom firmware to be programmed.

Enhanced In-Circuit Serial Programming uses an on-board bootloader, known as the Programming Executive, to manage the programming process. Using an SPI data frame format, the Programming Executive can erase, program and verify program memory. For more information on Enhanced ICSP, see the device programming specification.

RTSP is accomplished using TBLRD (Table Read) and TBLWT (Table Write) instructions. With RTSP, the user application can write program memory data by double program memory words or by blocks (‘rows’) of 128 instructions (256 addressable bytes). RTSP can erase program memory in blocks or ‘pages’ of 1024 instructions (2048 addressable bytes) at a time.

### 5.1 Table Instructions and Flash Programming

Regardless of the method used, all programming of Flash memory is done with the Table Read and Table Write instructions. These allow direct read and write access to the program memory space from the data memory while the device is in normal operating mode. The 24-bit target address in the program memory is formed using bits[7:0] of the TBLPAG register and the Effective Address (EA) from a W register, specified in the table instruction, as shown in Figure 5-1. The TBLRDL and TBLWTL instructions are used to read or write to bits[15:0] of program memory. TBLRDL and TBLWTL can access program memory in both Word and Byte modes. The TBLRDH and TBLWTH instructions are used to read or write to bits[23:16] of program memory. TBLRDH and TBLWTH can also access program memory in Word or Byte mode.

**FIGURE 5-1: ADDRESSING FOR TABLE REGISTERS**

# dsPIC33CK64MC105 FAMILY

## 5.2 RTSP Operation

The dsPIC33CK64MC105 family Flash program memory array is organized into rows of 128 instructions or 384 bytes. RTSP allows the user application to erase a single page (eight rows or 1024 instructions) of memory at a time and to program one row at a time. It is possible to program two instructions at a time as well.

The page erase and single row write blocks are edge-aligned, from the beginning of program memory, on boundaries of 3072 bytes and 384 bytes, respectively. Table 31-17 in Section 31.0 “Electrical Characteristics” lists the typical erase and programming times. To write into the Flash memory, it is necessary to erase the page that contains the desired address of the location the user wants to change.

Row programming is performed by loading 384 bytes into data memory and then loading the address of the first byte in that row into the NVMSRCADRL/H register pair. Once the write has been initiated, the device will automatically load the write latches, and increment the NVMSRCADRL/H and the NVMADR/U registers until all bytes have been programmed. The RPDF bit (NVMCON[9]) selects the format of the stored data in RAM to be either compressed or uncompressed. See Figure 5-2 for data formatting. Compressed data help to reduce the amount of required RAM by using the upper byte of the second word for the MSB of the second instruction.

The basic sequence for RTSP word programming is to use the TBLWTL and TBLWTH instructions to load two of the 24-bit instructions into the write latches found in configuration memory space. Refer to Figure 4-1 through Figure 4-3 for write latch addresses. Programming is performed by unlocking and setting the control bits in the NVMCON register.

All erase and program operations may optionally use the NVM interrupt to signal the successful completion of the operation.

FIGURE 5-2: UNCOMPRESSED/COMPRESSED FORMAT

A complete programming sequence is necessary for programming or erasing the internal Flash in RTSP mode. The processor stalls (waits) until the programming operation is finished. Setting the WR bit (NVMCON[15]) starts the operation and the WR bit is automatically cleared when the operation is finished. The WR bit is protected against an accidental write. To set this bit, 0x55 and 0xAA values must be written sequentially into the NVMKEY register. After the programming command (WR bit = 1) has been executed, the user application must wait until programming is complete (WR bit = 0). The two instructions following the start of the programming sequence should be NOPs.

**Note:** MPLAB® XC16 provides a built-in C language function, including the unlocking sequence to set the WR bit in the NVMCON register:

```
_builtin_write_NVM()
```

## 5.3 Program Flash Memory Control Registers

Six SFRs are used to write and erase the Program Flash Memory: NVMCON, NVMKEY, NVMADR/U and NVMSRCADRL/H.

The NVMCON register ([Register 5-1](#)) selects the operation to be performed (page erase, word/row program, Inactive Partition erase) and initiates the program or erase cycle.

NVMKEY ([Register 5-4](#)) is a write-only register that is used for write protection. To start a programming or erase sequence, the user application must consecutively write 0x55 and 0xAA to the NVMKEY register.

There are two NVM Address registers: NVMADRU and NVMADR. These two registers, when concatenated, form the 24-bit Effective Address (EA) of the selected word/row for programming operations, or the selected page for erase operations. The NVMADRU register is used to hold the upper eight bits of the EA, while the NVMADR register is used to hold the lower 16 bits of the EA.

For row programming operation, data to be written to Program Flash Memory are written into data memory space (RAM) at an address defined by the NVMSRCADRL/H register pair (location of first element in row programming data).

 The RAM address of the data to be programmed into Flash when the NVMOP[3:0] bits are set to row programming.

## 5.4 Error Correcting Code (ECC)

In order to improve program memory performance and durability, these devices include Error Correcting Code (ECC) functionality as an integral part of the Flash memory controller. ECC can determine the presence of single-bit errors in program data, including which bit is in error, and correct the data automatically without user intervention. ECC cannot be disabled.

When data are written to program memory, ECC generates a 7-bit Hamming code parity value for every two (24-bit) instruction words. The data are stored in blocks of 48 data bits and seven parity bits; parity data are not memory-mapped and are inaccessible. When the data are read back, the ECC calculates the parity on them and compares it to the previously stored parity value. If a parity mismatch occurs, there are two possible outcomes:

- Single-bit error has occurred and has been automatically corrected on readback.
- Double-bit error has occurred and the read data are not changed.

Single-bit error occurrence can be identified by the state of the ECCSBEIF (IFS0[13]) bit. An interrupt can be generated when the corresponding interrupt enable bit is set, ECCSBEIE (IEC0[13]). The ECCSTATL register contains the parity information for single-bit errors. The SECOUT[7:0] bits field contains the expected calculated SEC parity and the SECIN[7:0] bits contain the actual value from a Flash read operation. The SECSYNDx bits (ECCSTATH[7:0]) indicate the bit position of the single-bit error within the 48-bit pair of instruction words. When no error is present, SECINx equals SECOUTx and SECSYNDx is zero. The ECCSTATL and ECCSTATH registers will only update and be valid when an error has occurred, or when included Fault injection is enabled, and an ECCADDR match occurs.

Double-bit errors result in a generic hard trap. The ECCDBE bit (INTCON4[1]) bit will be set to identify the source of the hard trap. If no Interrupt Service Routine is implemented for the hard trap, a device Reset will also occur. The ECCSTATH register contains double-bit error status information. The DEDOUT bit is the expected calculated DED parity and DEDIN is the actual value from a Flash read operation. When no error is present, DEDIN equals DEDOUT.

### 5.4.1 ECC FAULT INJECTION

To test Fault handling, an EEC error can be generated. Both single and double-bit errors can be generated in both the read and write data paths. Read path Fault injection first reads the Flash data and then modifies them prior to entering the ECC logic. Write path Fault injection modifies the actual data prior to them being written into the target Flash and will cause an EEC error on a subsequent Flash read. The following procedure is used to inject a Fault:

1. Load the Flash target address into the ECCADDR register.
2. Select 1st Fault bit determined by FLT1PTRx (ECCCONH[7:0]). The target bit is inverted to create the Fault.
3. If a double Fault is desired, select the 2nd Fault bit determined by FLT2PTRx (ECCCONH[15:8]), otherwise set to all '1's.
4. Write the NVMKEY unlock sequence (see [Section 5.3 "Program Flash Memory Control Registers"](#)).
5. Enable the ECC Fault injection logic by setting the FLTINJ bit (ECCCONL[0]).
6. Perform a read or write to the Flash target address.

                   Indicates the bit location that contains the error.

## 5.5 Flash OTP by ICSP™ Write Inhibit

ICSP Write Inhibit is an access restriction feature, that when activated, restricts all of Flash memory. Once activated, ICSP Write Inhibit permanently prevents ICSP Flash programming and erase operations, and cannot be deactivated. This feature is intended to prevent alteration of Flash memory contents, with behavior similar to One-Time-Programmable (OTP) devices.

RTSP, including erase and programming operations, is not restricted when ICSP Write Inhibit is activated; however, code to perform these actions must be programmed into the device before ICSP Write Inhibit is activated. This allows for a bootloader-type application to alter Flash contents with ICSP Write Inhibit activated.

Entry into ICSP and Enhanced ICSP modes is not affected by ICSP Write Inhibit. In these modes, it will continue to be possible to read configuration memory space and any user memory space regions which are not code-protected. With ICSP writes inhibited, an attempt to set WR (NVMCON[15]) = 1 will maintain WR = 0, and instead, set WRERR (NVMCON[13]) = 1. All Enhanced ICSP erase and programming commands will have no effect with self-checked programming commands returning a FAIL response opcode (PASS if the destination already exactly matched the requested programming data).

Once ICSP Write Inhibit is activated, it is not possible for a device executing in Debug mode to erase/write Flash, nor can a debug tool switch the device to Production mode. ICSP Write Inhibit should therefore only be activated on devices programmed for production.

### 5.5.1 ACTIVATING FLASH OTP BY ICSP WRITE INHIBIT

**Note:** It is not possible to deactivate ICSP Write Inhibit.

ICSP Write Inhibit is activated by executing a pair of NVMCON double-word programming commands to save two 16-bit activation values in the configuration memory space. The target NVM addresses and values required for activation are shown in [Table 5-1](#). Once both addresses contain their activation values, ICSP Write Inhibit will take permanent effect on the next device Reset.

Only the lower 16 data bits stored at the activation addresses are evaluated; the upper eight bits and second 24-bit word written by the double-word programming should be written as '0's. The addresses can be programmed in any order and also during separate ICSP/Enhanced ICSP/RTSP sessions, but any attempt to program an incorrect 16-bit value or use a row programming operation to program the values will be aborted without altering the existing data.

**TABLE 5-1: ICSP™ WRITE INHIBIT ACTIVATION ADDRESSES AND DATA**

	Configuration Memory Address	ICSP™ Write Inhibit Activation Value
Write Lock 1	0x801028	0x006D63
Write Lock 2	0x80102C	0x006870

## 6.0 RESETS

**Note 1:** This data sheet summarizes the features of the dsPIC33CK64MC105 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “Reset” ([www.microchip.com/DS70602](http://www.microchip.com/DS70602)) in the “dsPIC33/PIC24 Family Reference Manual”.

**2:** Some registers and associated bits described in this section may not be available on all devices.

The Reset module combines all Reset sources and controls the device Master Reset Signal,  $\overline{\text{SYSRST}}$ . The following is a list of device Reset sources:

- POR: Power-on Reset
- BOR: Brown-out Reset
- MCLR: Master Clear Pin Reset
- SWR: RESET Instruction
- WDTO: Watchdog Timer Time-out Reset
- CM: Configuration Mismatch Reset
- TRAPR: Trap Conflict Reset
- IOPUWR: Illegal Condition Device Reset
  - Illegal Opcode Reset
  - Uninitialized W Register Reset
  - Security Reset

A simplified block diagram of the Reset module is shown in [Figure 6-1](#).

Any active source of Reset will make the  $\overline{\text{SYSRST}}$  signal active. On system Reset, some of the registers associated with the CPU and peripherals are forced to a known Reset state and some are unaffected.

**Note:** Refer to the specific peripheral section or [Section 4.0 “Memory Organization”](#) of this manual for register Reset states.

All types of device Reset set a corresponding status bit in the RCON register to indicate the type of Reset (see [Register 6-1](#)).

A POR clears all the bits, except for the BOR and POR bits (RCON[1:0]) that are set. The user application can set or clear any bit, at any time, during code execution. The RCON bits only serve as status bits. Setting a particular Reset status bit in software does not cause a device Reset to occur.

The RCON register also has other bits associated with the Watchdog Timer and device Power-Saving states. The function of these bits is discussed in other sections of this manual.

**Note:** The status bits in the RCON register should be cleared after they are read so that the next RCON register value after a device Reset is meaningful.

For all Resets, the default clock source is determined by the FNOSC[2:0] bits in the FOSCSEL Configuration register. The value of the FNOSCx bits is loaded into the NOSC[2:0] (OSCCON[10:8]) bits on Reset, which in turn, initializes the system clock.

**FIGURE 6-1: RESET SYSTEM BLOCK DIAGRAM**

NOTES:

## 7.0 INTERRUPT CONTROLLER

**Note 1:** This data sheet summarizes the features of the dsPIC33CK64MC105 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “Interrupts” ([www.microchip.com/DS70000600](http://www.microchip.com/DS70000600)) in the “dsPIC33/PIC24 Family Reference Manual”.

**2:** Some registers and associated bits described in this section may not be available on all devices.

The dsPIC33CK64MC105 family interrupt controller reduces the numerous peripheral interrupt request signals to a single interrupt request signal to the dsPIC33CK64MC105 family CPU.

The interrupt controller has the following features:

- Six Processor Exceptions and Software Traps
- Seven User-Selectable Priority Levels
- Interrupt Vector Table (IVT) with a Unique Vector for each Interrupt or Exception Source
- Fixed Priority within a Specified User Priority Level
- Fixed Interrupt Entry and Return Latencies
- Alternate Interrupt Vector Table (AIVT) for Debug Support

### 7.1 Interrupt Vector Table

The dsPIC33CK64MC105 family Interrupt Vector Table (IVT), shown in [Figure 7-1](#), resides in program memory, starting at location, 000004h. The IVT contains six non-maskable trap vectors and up to 246 sources of interrupts. In general, each interrupt source has its own vector. Each interrupt vector contains a 24-bit wide address. The value programmed into each interrupt vector location is the starting address of the associated Interrupt Service Routine (ISR).

Interrupt vectors are prioritized in terms of their natural priority. This priority is linked to their position in the vector table. Lower addresses generally have a higher natural priority. For example, the interrupt associated with Vector 0 takes priority over interrupts at any other vector address.

### 7.1.1 ALTERNATE INTERRUPT VECTOR TABLE

The Alternate Interrupt Vector Table (AIVT), shown in [Figure 7-2](#), is available only when the Boot Segment (BS) is defined and the AIVT has been enabled. To enable the Alternate Interrupt Vector Table, the Configuration bits, BSEN and AIVTDIS in the FSEC register, must be programmed, and the AIVTEN bit must be set (INTCON2[8] = 1). When the AIVT is enabled, all interrupt and exception processes use the alternate vectors instead of the default vectors. The AIVT begins at the start of the last page of the Boot Segment, defined by BSLIM[12:0]. The second half of the page is no longer usable space. The Boot Segment must be at least two pages to enable the AIVT.

**Note:** Although the Boot Segment must be enabled in order to enable the AIVT, application code does not need to be present inside of the Boot Segment. The AIVT (and IVT) will inherit the Boot Segment code protection.

The AIVT supports debugging by providing a means to switch between an application and a support environment without requiring the interrupt vectors to be reprogrammed. This feature also enables switching between applications for evaluation of different software algorithms at run time.

### 7.2 Reset Sequence

A device Reset is not a true exception because the interrupt controller is not involved in the Reset process. The dsPIC33CK64MC105 family devices clear their registers in response to a Reset, which forces the PC to zero. The device then begins program execution at location, 0x000000. A GOTO instruction at the Reset address can redirect program execution to the appropriate start-up routine.

**Note:** Any unimplemented or unused vector locations in the IVT should be programmed with the address of a default interrupt handler routine that contains a RESET instruction.

## 7.4 Interrupt Control and Status Registers

The dsPIC33CK64MC105 family devices implement the following registers for the interrupt controller:

- INTCON1
- INTCON2
- INTCON3
- INTCON4
- INTTREG

### 7.4.1 INTCON1 THROUGH INTCON4

Global interrupt control functions are controlled from INTCON1, INTCON2, INTCON3 and INTCON4.

INTCON1 contains the Interrupt Nesting Disable bit (NSTDIS), as well as the control and status flags for the processor trap sources.

The INTCON2 register controls external interrupt request signal behavior, contains the Global Interrupt Enable bit (GIE) and the Alternate Interrupt Vector Table Enable bit (AIVTEN).

INTCON3 contains the status flags for the DO stack overflow status trap sources.

The INTCON4 register contains the Software Generated Hard Trap Status bit (SGHT).

### 7.4.2 IFSx

The IFSx registers maintain all of the interrupt request flags. Each source of interrupt has a status bit, which is set by the respective peripherals or external signal and is cleared via software.

### 7.4.3 IECx

The IECx registers maintain all of the interrupt enable bits. These control bits are used to individually enable interrupts from the peripherals or external signals.

### 7.4.4 IPCx

The IPCx registers are used to set the Interrupt Priority Level (IPL) for each source of interrupt. Each user interrupt source can be assigned to one of seven priority levels.

### 7.4.5 INTTREG

The INTTREG register contains the associated interrupt vector number and the new CPU Interrupt Priority Level, which are latched into the Vector Number (VECNUM[7:0]) and Interrupt Level bits (ILR[3:0]) fields in the INTTREG register. The new Interrupt Priority Level is the priority of the pending interrupt.

The interrupt sources are assigned to the IFSx, IECx and IPCx registers in the same sequence as they are listed in [Table 7-2](#). For example, INT0 (External Interrupt 0) is shown as having Vector Number 8 and a natural order priority of 0. Thus, the INT0IF bit is found in IFS0[0], the INT0IE bit in IEC0[0] and the INT0IP[2:0] bits in the first position of IPC0 (IPC0[2:0]).

### 7.4.6 STATUS/CONTROL REGISTERS

Although these registers are not specifically part of the interrupt control hardware, two of the CPU Control registers contain bits that control interrupt functionality. For more information on these registers, refer to “**Enhanced CPU**” ([www.microchip.com/DS70005158](http://www.microchip.com/DS70005158)) in the “*dsPIC33/PIC24 Family Reference Manual*”.

- The CPU STATUS Register, SR, contains the IPL[2:0] bits (SR[7:5]). These bits indicate the current CPU Interrupt Priority Level. The user software can change the current CPU Interrupt Priority Level by writing to the IPLx bits.
- The CORCON register contains the IPL3 bit, which together with IPL[2:0], also indicates the current CPU priority level. IPL3 is a read-only bit so that trap events cannot be masked by the user software.

All Interrupt registers are described in [Register 7-3](#) through [Register 7-7](#) in the following pages.

# dsPIC33CK64MC105 FAMILY

## REGISTER 7-1: SR: CPU STATUS REGISTER<sup>(1)</sup>

R/W-0	R/W-0	R/W-0	R/W-0	R/C-0	R/C-0	R-0	R/W-0

## 8.0 I/O PORTS

**Note 1:** This data sheet summarizes the features of the dsPIC33CK64MC105 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “I/O Ports with Edge Detect” ([www.microchip.com/DS70005322](http://www.microchip.com/DS70005322)) in the “dsPIC33/PIC24 Family Reference Manual”.

**2:** Some registers and associated bits described in this section may not be available on all devices.

Many of the device pins are shared among the peripherals and the Parallel I/O ports. All I/O input ports feature Schmitt Trigger inputs for improved noise immunity. The PORT registers are located in the SFR.

Some of the key features of the I/O ports are:

- Individual Output Pin Open-Drain Enable/Disable
- Individual Input Pin Weak Pull-up and Pull-Down
- Monitor Selective Inputs and Generate Interrupt when Change in Pin State is Detected
- Operation during Sleep and Idle modes

## 8.1 Parallel I/O (PIO) Ports

All port pins have 12 registers directly associated with their operation as digital I/Os. The Data Direction register (TRISx) determines whether the pin is an input or an output. If the data direction bit is a ‘1’, then the pin is an input.

All port pins are defined as inputs after a Reset. Reads from the latch (LATx), read the latch. Writes to the latch, write the latch. Reads from the port (PORTx), read the port pins, while writes to the port pins, write the latch. Any bit and its associated data and control registers that are not valid for a particular device are disabled. This means the corresponding LATx and TRISx registers, and the port pin are read as zeros.

When a pin is shared with another peripheral or function that is defined as an input only, it is nevertheless regarded as a dedicated port because there is no other competing source of outputs. [Table 8-1](#) shows the pin availability. [Table 8-2](#) shows the 5V input tolerant pins across this device.

**Legend:** Shaded pins are up to 5.5 Vdc input tolerant.

**Note 1:** A pull-up resistor is connected to this pin during programming or when JTAG is enabled in the Configuration bits; this limits the maximum voltage on this pin to 3.6V. If JTAG is disabled, the maximum voltage on this pin can reach 5.5V.

# dsPIC33CK64MC105 FAMILY

FIGURE 8-1: BLOCK DIAGRAM OF A TYPICAL SHARED PORT STRUCTURE

# dsPIC33CK64MC105 FAMILY

## 8.1.1 OPEN-DRAIN CONFIGURATION

In addition to the PORTx, LATx and TRISx registers for data control, port pins can also be individually configured for either digital or open-drain output. This is controlled by the Open-Drain Enable for PORTx register, ODCx, associated with each port. Setting any of the bits configures the corresponding pin to act as an open-drain output.

The open-drain feature allows the generation of outputs, other than VDD, by using external pull-up resistors. The maximum open-drain voltage allowed on any pin is the same as the maximum VIH specification for that particular pin.

## 8.2 Configuring Analog and Digital Port Pins

The ANSELx registers control the operation of the analog port pins. The port pins that are to function as analog inputs must have their corresponding ANSELx and TRISx bits set. In order to use port pins for I/O functionality with digital modules, such as timers, UARTs, etc., the corresponding ANSELx bit must be cleared.

The ANSELx registers have a default value of 0xFFFF; therefore, all pins that share analog functions are analog (not digital) by default.

Pins with analog functions affected by the ANSELx registers are listed with a buffer type of analog in the Pinout I/O Descriptions (see Table 1-1).

If the TRISx bit is cleared (output) while the ANSELx bit is set, the digital output level (VOH or VOL) is converted by an analog peripheral, such as the ADC module or comparator module.

When the PORTx register is read, all pins configured as analog input channels are read as cleared (a low level).

Pins configured as digital inputs do not convert an analog input. Analog levels on any pin, defined as a digital input (including the ANx pins), can cause the input buffer to consume current that exceeds the device specifications.

## 8.2.1 I/O PORT WRITE/READ TIMING

One instruction cycle is required between a port direction change or port write operation and a read operation of the same port. Typically, this instruction would be a NOP.

## 8.3 Control Registers

The following registers are in the PORT module:

- Register 8-1: ANSELx (one per port)
- Register 8-2: TRISx (one per port)
- Register 8-3: PORTx (one per port)
- Register 8-4: LATx (one per port)
- Register 8-5: ODCx (one per port)
- Register 8-6: CNPUx (one per port)
- Register 8-7: CNPDx (one per port)
- Register 8-8: CNCONx (one per port – optional)
- Register 8-9: CNEN0x (one per port)
- Register 8-10: CNSTATx (one per port – optional)
- Register 8-11: CNEN1x (one per port)
- Register 8-12: CNFx (one per port)

## 8.4 Input Change Notification (ICN)

The Input Change Notification function of the I/O ports allows the dsPIC33CK64MC105 family devices to generate interrupt requests to the processor in response to a Change-of-State (COS) on selected input pins. This feature can detect input Change-of-States, even in Sleep mode, when the clocks are disabled. Every I/O port pin can be selected (enabled) for generating an interrupt request on a Change-of-State. Five control registers are associated with the Change Notification (CN) functionality of each I/O port. To enable the Change Notification feature for the port, the ON bit (CNCONx[15]) must be set.

The CNEN0x and CNEN1x registers contain the CN interrupt enable control bits for each of the input pins. The setting of these bits enables a CN interrupt for the corresponding pins. Also, these bits, in combination with the CNSTYLE bit (CNCONx[11]), define a type of transition when the interrupt is generated. Possible CN event options are listed in [Table 8-3](#).

**TABLE 8-3: CHANGE NOTIFICATION EVENT OPTIONS**

CNSTYLE Bit (CNCONx[11])	CNEN1x Bit	CNEN0x Bit	Change Notification Event Description
0	Does not matter	0	Disabled
0	Does not matter	1	Detects a mismatch between the last read state and the current state of the pin
1	0	0	Disabled
1	0	1	Detects a positive transition only (from '0' to '1')
1	1	0	Detects a negative transition only (from '1' to '0')
1	1	1	Detects both positive and negative transitions

The CNSTATx register indicates whether a change occurred on the corresponding pin since the last read of the PORTx bit. In addition to the CNSTATx register, the CNFx register is implemented for each port. This register contains flags for Change Notification events. These flags are set if the valid transition edge, selected in the CNEN0x and CNEN1x registers, is detected. CNFx stores the occurrence of the event. CNFx bits must be cleared in software to get the next Change Notification interrupt. The CN interrupt is generated only for the I/Os configured as inputs (corresponding TRISx bits must be set).

**Note:** Pull-ups and pull-downs on Input Change Notification pins should always be disabled when the port pin is configured as a digital output.

## 8.5 Peripheral Pin Select (PPS)

A major challenge in general purpose devices is providing the largest possible set of peripheral features, while minimizing the conflict of features on I/O pins. The challenge is even greater on low pin count devices. In an application where more than one peripheral needs to be assigned to a single pin, inconvenient work arounds in application code, or a complete redesign, may be the only option.

Peripheral Pin Select configuration provides an alternative to these choices by enabling peripheral set selection and placement on a wide range of I/O pins. By increasing the pinout options available on a particular device, users can better tailor the device to their entire application, rather than trimming the application to fit the device.

The Peripheral Pin Select configuration feature operates over a fixed subset of digital I/O pins. Users may independently map the input and/or output of most digital peripherals to any one of these I/O pins. Hardware safeguards are included that prevent accidental or spurious changes to the peripheral mapping once it has been established.

### 8.5.1 AVAILABLE PINS

The number of available pins is dependent on the particular device and its pin count. Pins that support the Peripheral Pin Select feature include the label, "RPn", in their full pin designation, where "n" is the remappable pin number. "RP" is used to designate pins that support both remappable input and output functions.

### 8.5.2 AVAILABLE PERIPHERALS

The peripherals managed by the Peripheral Pin Select are all digital only peripherals. These include general serial communications (UART and SPI), general purpose timer clock inputs, timer-related peripherals (input capture and output compare) and interrupt-on-change inputs.

In comparison, some digital only peripheral modules are never included in the Peripheral Pin Select feature. This is because the peripheral's function requires special I/O circuitry on a specific port and cannot be easily connected to multiple pins. One example includes I<sup>2</sup>C modules. A similar requirement excludes all modules with analog inputs, such as the A/D Converter (ADC).

A key difference between remappable and non-remappable peripherals is that remappable peripherals are not associated with a default I/O pin. The peripheral must always be assigned to a specific I/O pin before it can be used. In contrast, non-remappable peripherals are always available on a default pin, assuming that the peripheral is active and not conflicting with another peripheral.

# dsPIC33CK64MC105 FAMILY

When a remappable peripheral is active on a given I/O pin, it takes priority over all other digital I/Os and digital communication peripherals associated with the pin. Priority is given regardless of the type of peripheral that is mapped. Remappable peripherals never take priority over any analog functions associated with the pin.

## 8.5.3 CONTROLLING CONFIGURATION CHANGES

Because peripheral mapping can be changed during run time, some restrictions on peripheral remapping are needed to prevent accidental configuration changes. The dsPIC33CK64MC105 devices have implemented the control register lock sequence.

After a Reset, writes to the RPINRx and RPORx registers are allowed, but they can be disabled by setting the IOLOCK bit (RPCON[11]). Attempted writes with the IOLOCK bit set will appear to execute normally, but the contents of the registers will remain unchanged. Setting IOLOCK prevents writes to the control registers; clearing IOLOCK allows writes. To set or clear IOLOCK, the NVMKEY unlock sequence must be executed:

1. Write 0x55 to NVMKEY.
2. Write 0xAA to NVMKEY.
3. Clear (or set) IOLOCK as a single operation.

**Note:** MPLAB® XC16 compiler provides a built-in C language function for unlocking and modifying the RPCON register:  

```
__builtin_write_RPCON(value);
```

 For more information, see the XC16 compiler help files.

## 8.5.4 INPUT MAPPING

The inputs of the Peripheral Pin Select options are mapped on the basis of the peripheral. That is, a control register associated with a peripheral dictates the pin it will be mapped to. The RPINRx registers are used to configure peripheral input mapping. Each register contains sets of 8-bit fields, with each set associated with one of the remappable peripherals. Programming a given peripheral's bit field with an appropriate 8-bit index value maps the RPn pin with the corresponding value, or internal signal, to that peripheral. See Table 8-4 for a list of available inputs.

For example, Figure 8-2 illustrates remappable pin selection for the U1RX input. Example 8-1 provides a configuration for bidirectional communication with flow control using UART1. The following input and output functions are used:

- Input Functions: U1RX, U1CTS
- Output Functions: U1TX, U1RTS

## EXAMPLE 8-1: CONFIGURING UART1 INPUT AND OUTPUT FUNCTIONS

```
//
//*****
// Unlock Registers
//*****
__builtin_write_RPCON(0x0000);
//*****
// Configure Input Functions (See Table 8-5)
// Assign U1Rx To Pin RP35
//*****
_U1RXR = 35;
// Assign U1CTS To Pin RP36
//*****
_U1CTSR = 36;
//*****
// Configure Output Functions (See Table 8-7)
//*****
// Assign U1Tx To Pin RP37
//*****
_RP37R = 1;
//*****
// Assign U1RTS To Pin RP38
//*****
_RP38R = 2;
//*****
// Lock Registers
//*****
__builtin_write_RPCON(0x0800);
```

FIGURE 8-2: REMAPPABLE INPUT FOR U1RX

**Note:** For input only, Peripheral Pin Select functionality does not have priority over TRISx settings. Therefore, when configuring an RPn pin for input, the corresponding bit in the TRISx register must also be configured for input (set to '1'). Physical connection to a pin can be made through RP32 through RP77. There are internal signals and virtual pins that can be connected to an input. Table 8-4 shows the details of the input assignment.

## 8.5.5 VIRTUAL CONNECTIONS

The dsPIC33CK64MC105 devices support six virtual RPn pins (RP176-RP181), which are identical in functionality to all other RPn pins, with the exception of pinouts. These six pins are internal to the devices and are not connected to a physical device pin.

These pins provide a simple way for inter-peripheral connection without utilizing a physical pin. For example, the output of the analog comparator can be connected to RP176 and the PWM Fault input can be configured for RP176 as well. This configuration allows the analog comparator to trigger PWM Faults without the use of an actual physical pin on the device.

## 8.5.6 OUTPUT MAPPING

In contrast to inputs, the outputs of the Peripheral Pin Select options are mapped on the basis of the pin. In this case, a control register associated with a particular pin dictates the peripheral output to be mapped. The RPORx registers are used to control output mapping. Each register contains sets of 6-bit fields, with each set associated with one RPn pin (see [Register 8-43](#) through [Register 8-62](#)). The value of the bit field corresponds to one of the peripherals and that peripheral's output is mapped to the pin (see [Table 8-7](#) and [Figure 8-3](#)).

A null output is associated with the output register Reset value of '0'. This is done to ensure that remappable outputs remain disconnected from all output pins by default.

## 8.5.7 MAPPING LIMITATIONS

The control schema of the peripheral select pins is not limited to a small range of fixed peripheral configurations. There are no mutual or hardware-enforced lockouts between any of the peripheral mapping SFRs. Literally, any combination of peripheral mappings, across any or all of the RPn pins, is possible. This includes both many-to-one and one-to-many mappings of peripheral inputs, and outputs to pins. While such mappings may be technically possible from a configuration point of view, they may not be supportable from an electrical point of view (see [Table 8-6](#)).

**FIGURE 8-3: MULTIPLEXING REMAPPABLE OUTPUTS FOR RPn**

**Note 1:** There are six virtual output ports which are not connected to any I/O ports (RP176-RP181). These virtual ports can be accessed by RPOR17, RPOR18 and RPOR19.

## 8.5.8 I/O HELPFUL TIPS

1. In some cases, certain pins, as defined in [Table 31-14](#) under “Injection Current”, have internal protection diodes to VDD and VSS. The term, “Injection Current”, is also referred to as “Clamp Current”. On designated pins, with sufficient external current-limiting precautions by the user, I/O pin input voltages are allowed to be greater or lesser than the data sheet absolute maximum ratings, with respect to the VSS and VDD supplies. Note that when the user application forward biases either of the high or low-side internal input clamp diodes, that the resulting current being injected into the device that is clamped internally by the VDD and VSS power rails, may affect the ADC accuracy by four to six counts.
2. I/O pins that are shared with any analog input pin (i.e., ANx) are always analog pins, by default, after any Reset. Consequently, configuring a pin as an analog input pin automatically disables the digital input pin buffer and any attempt to read the digital input level by reading PORTx or LATx will always return a ‘0’, regardless of the digital logic level on the pin. To use a pin as a digital I/O pin on a shared ANx pin, the user application needs to configure the Analog Select for PORTx registers in the I/O ports module (i.e., ANSELx) by setting the appropriate bit that corresponds to that I/O port pin to a ‘0’.

**Note:** Although it is not possible to use a digital input pin when its analog function is enabled, it is possible to use the digital I/O output function,  $TRISx = 0 \times 0$ , while the analog function is also enabled. However, this is not recommended, particularly if the analog input is connected to an external analog voltage source, which would create signal contention between the analog signal and the output pin driver.

3. Most I/O pins have multiple functions. Referring to the device pin diagrams in this data sheet, the priorities of the functions allocated to any pins are indicated by reading the pin name, from left-to-right. The left most function name takes precedence over any function to its right in the naming convention. For example: AN16/T2CK/T7CK/RC1; this indicates that AN16 is the highest priority in this example and will supersede all other functions to its right in the list. Those other functions to its right, even if enabled, would not work as long as any other function to its left was enabled. This rule applies to all of the functions listed for a given pin.
4. Each pin has an internal weak pull-up resistor and pull-down resistor that can be configured using the CNPUs and CNPDx registers, respectively. These resistors eliminate the need for external resistors in certain applications. The internal pull-up is up to  $\sim(VDD - 0.8)$ , not VDD. This value is still above the minimum  $V_{IH}$  of CMOS and TTL devices.
5. When driving LEDs directly, the I/O pin can source or sink more current than what is specified in the  $V_{OH}/I_{OH}$  and  $V_{OL}/I_{OL}$  DC characteristics specification. The respective  $I_{OH}$  and  $I_{OL}$  current rating only applies to maintaining the corresponding output at or above the  $V_{OH}$ , and at or below the  $V_{OL}$  levels. However, for LEDs, unlike digital inputs of an externally connected device, they are not governed by the same minimum  $V_{IH}/V_{IL}$  levels. An I/O pin output can safely sink or source any current less than that listed in the Absolute Maximum Ratings in [Section 31.0 “Electrical Characteristics”](#) of this data sheet. For example:

$$V_{OH} = 2.4V @ I_{OH} = -8 \text{ mA and } V_{DD} = 3.3V$$

The maximum output current sourced by any 8 mA I/O pin = 12 mA.

LED source current < 12 mA is technically permitted.

6. The Peripheral Pin Select (PPS) pin mapping rules are as follows:

- a) Only one “output” function can be active on a given pin at any time, regardless if it is a dedicated or remappable function (one pin, one output).
- b) It is possible to assign a “remappable output” function to multiple pins and externally short or tie them together for increased current drive.
- c) If any “dedicated output” function is enabled on a pin, it will take precedence over any remappable “output” function.
- d) If any “dedicated digital” (input or output) function is enabled on a pin, any number of “input” remappable functions can be mapped to the same pin.
- e) If any “dedicated analog” function(s) are enabled on a given pin, “digital input(s)” of any kind will all be disabled, although a single “digital output”, at the user’s cautionary discretion, can be enabled and active as long as there is no signal contention with an external analog input signal. For example, it is possible for the ADC to convert the digital output logic level, or to toggle a digital output on a comparator or ADC input, provided there is no external analog input, such as for a Built-In Self-Test (BIST).
- f) Any number of “input” remappable functions can be mapped to the same pin(s) at the same time, including to any pin with a single output from either a dedicated or remappable “output”.
- g) The TRISx registers control *only* the digital I/O output buffer. Any other dedicated or remappable active “output” will automatically override the TRISx setting. The TRISx register *does not* control the digital logic “input” buffer. Remappable digital “inputs” do not automatically override TRISx settings, which means that the TRISx bit must be set to input for pins with only remappable input function(s) assigned.
- h) All analog pins are enabled by default after any Reset and the corresponding digital input buffer on the pin has been disabled. Only the Analog Select for PORTx (ANSELx) registers control the digital input buffer, *not* the TRISx register. The user must disable the analog function on a pin using the Analog Select for PORTx registers in order to use any “digital input(s)” on a corresponding pin, no exceptions.

## 8.5.9 I/O PORTS RESOURCES

Many useful resources are provided on the main product page of the Microchip website for the devices listed in this data sheet. This product page contains the latest updates and additional information.

## 9.0 OSCILLATOR WITH HIGH-FREQUENCY PLL

**Note 1:** This data sheet summarizes the features of the dsPIC33CK64MC105 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “Oscillator Module with High-Speed PLL” ([www.microchip.com/DS70005255](http://www.microchip.com/DS70005255)) in the “dsPIC33/PIC24 Family Reference Manual”.

The dsPIC33CK64MC105 family oscillator with high-frequency PLL includes these characteristics:

- On-Chip Phase-Locked Loop (PLL) to Boost Internal Operating Frequency on Select Internal and External Oscillator Sources
- Doze mode for System Power Savings
- Scalable Reference Clock Output (REFCLKO)
- On-the-Fly Clock Switching between Various Clock Sources
- Fail-Safe Clock Monitoring (FSCM) that Detects Clock Failure and Permits Safe Application Recovery or Shutdown

A block diagram of the dsPIC33CK64MC105 oscillator system is shown in [Figure 9-1](#).

**FIGURE 9-1: dsPIC33CK64MC105 CORE CLOCK SOURCES BLOCK DIAGRAM**

# dsPIC33CK64MC105 FAMILY

**FIGURE 9-2: dsPIC33CK64MC105 CORE OSCILLATOR SUBSYSTEM**

# dsPIC33CK64MC105 FAMILY

## 9.1 Primary PLL

The Primary Oscillator and internal FRC Oscillator sources can optionally use an on-chip PLL to obtain higher operating speeds. Figure 9-3 illustrates a block diagram of the PLL module.

For PLL operation, the following requirements must be met at all times without exception:

- The PLL Input Frequency (F<sub>PLL</sub>) must be in the range of 8 MHz to 64 MHz
- The PFD Input Frequency (F<sub>PFD</sub>) must be in the range of 8 MHz to (F<sub>VCO</sub>/16) MHz

The VCO Output Frequency (F<sub>VCO</sub>) must be in the range of 400 MHz to 1600 MHz

**FIGURE 9-3: PLL AND VCO DETAIL**

# dsPIC33CK64MC105 FAMILY

---

Equation 9-1 provides the relationship between the PLL Input Frequency ( $F_{PLLI}$ ) and VCO Output Frequency ( $F_{VCO}$ ).

## EQUATION 9-1: $F_{VCO}$ CALCULATION

$$F_{VCO} = F_{PLLI} \times \left( \frac{M}{N1} \right) = F_{PLLI} \times \left( \frac{PLLFBDIV[7:0]}{PLLPRE[3:0]} \right)$$

Equation 9-2 provides the relationship between the PLL Input Frequency ( $F_{PLLI}$ ) and PLL Output Frequency ( $F_{PLLO}$ ).

## EQUATION 9-2: $F_{PLLO}$ CALCULATION

$$F_{PLLO} = F_{PLLI} \times \left( \frac{M}{N1 \times N2 \times N3} \right) = F_{PLLI} \times \left( \frac{PLLFBDIV[7:0]}{PLLPRE[3:0] \times POST1DIV[2:0] \times POST2DIV[2:0]} \right)$$

Where:

$$M = PLLFBDIV[7:0]$$

$$N1 = PLLPRE[3:0]$$

$$N2 = POST1DIV[2:0]$$

$$N3 = POST2DIV[2:0]$$

**Note:** The PLL Phase Detector Input Divider Select (PLLPREx) bits and the PLL Feedback Divider (PLLFBDIVx) bits should not be changed when operating in PLL mode. Therefore, the user must start in either a non-PLL mode or clock switch to a non-PLL mode (e.g., internal FRC Oscillator) to make any necessary changes and then clock switch to the desired PLL mode.

It is not permitted to directly clock switch from one PLL clock source to a different PLL clock source. The user would need to transition between PLL clock sources with a clock switch to a non-PLL clock source.

# dsPIC33CK64MC105 FAMILY

[Example 9-1](#) illustrates code for using the PLL (50 MIPS) with the Primary Oscillator.

## EXAMPLE 9-1: CODE EXAMPLE FOR USING PLL (50 MIPS) WITH PRIMARY OSCILLATOR (POSC)

```
//code example for 50 MIPS system clock using POSC with 10 MHz external crystal

// Select Internal FRC at POR
_FOSCSEL(FNOSC_FRC & IESO_OFF);

// Enable Clock Switching and Configure POSC in XT mode
_FOSC(FCKSM_CSECMD & POSCMD_XT);

int main()
{
    // Configure PLL prescaler, both PLL postscalers, and PLL feedback divider
    CLKDIVbits.PLLPRE = 1;          // N1=1
    PLLFBDbits.PLLFBDIV = 100;     // M = 100
    PLLDIVbits.POST1DIV = 5;       // N2=5
    PLLDIVbits.POST2DIV = 1;       // N3=1

    // Initiate Clock Switch to Primary Oscillator with PLL (NOSC=0b011)
    __builtin_write_OSCCONH(0x03);
    __builtin_write_OSCCONL(OSCCON | 0x01);

    // Wait for Clock switch to occur
    while (OSCCONbits.OSWEN!= 0);

    // Wait for PLL to lock
    while (OSCCONbits.LOCK!= 1);
}
```

[Example 9-2](#) illustrates code for using the PLL with an 8 MHz internal FRC.

## EXAMPLE 9-2: CODE EXAMPLE FOR USING PLL (50 MIPS) WITH 8 MHz INTERNAL FRC

```
//code example for 50 MIPS system clock using 8MHz FRC

// Select Internal FRC at POR
_FOSCSEL(FNOSC_FRC & IESO_OFF);

// Enable Clock Switching
_FOSC(FCKSM_CSECMD);

int main()
{
    // Configure PLL prescaler, both PLL postscalers, and PLL feedback divider
    CLKDIVbits.PLLPRE = 1;          // N1=1
    PLLFBDbits.PLLFBDIV = 125;     // M = 125
    PLLDIVbits.POST1DIV = 5;       // N2=5
    PLLDIVbits.POST2DIV = 1;       // N3=1

    // Initiate Clock Switch to FRC with PLL (NOSC=0b001)
    __builtin_write_OSCCONH(0x01);
    __builtin_write_OSCCONL(OSCCON | 0x01);

    // Wait for Clock switch to occur
    while (OSCCONbits.OSWEN!= 0);

    // Wait for PLL to lock
    while (OSCCONbits.LOCK!= 1);
}
```

# dsPIC33CK64MC105 FAMILY

## 9.2 CPU Clocking

The dsPIC33CK64MC105 devices can be configured to use any of the following clock configurations:

- Primary Oscillator (POSC) on the OSC1 and OSC0 pins
- Internal Fast RC Oscillator (FRC) with optional clock divider
- Internal Low-Power RC Oscillator (LPRC)
- Primary Oscillator with PLL (ECPLL, HSPLL, XTPLL)
- Internal Fast RC Oscillator with PLL (FRCPLL)
- Backup Internal Fast RC Oscillator (BFRC)

The system clock source is divided by two to produce the internal instruction cycle clock. In this document, the instruction cycle clock is denoted by FCY. The timing diagram in Figure 9-4 illustrates the relationship between the system clock (FOSC), the instruction cycle clock (FCY) and the Program Counter (PC).

The internal instruction cycle clock (FCY) can be output on the OSC0 I/O pin if the Primary Oscillator mode (POSCMD[1:0]) is not configured as HS/XT. For more information, see Section 9.0 “Oscillator with High-Frequency PLL”.

**FIGURE 9-4: CLOCK AND INSTRUCTION CYCLE TIMING**

## 9.3 Primary Oscillator (POSC)

The dsPIC33CK64MC105 family devices feature a Primary Oscillator (POSC) and it is available on the OSCI and OSCO pins. This connection enables an external crystal (or ceramic resonator) to provide the clock to the device. The Primary Oscillator provides three modes of operation:

- **Medium Speed Oscillator (XT Mode):**  
The XT mode is a Medium Gain, Medium Frequency mode used to work with crystal frequencies of 3.5 MHz to 10 MHz.
- **High-Speed Oscillator (HS Mode):**  
The HS mode is a High-Gain, High-Frequency mode used to work with crystal frequencies of 10 MHz to 32 MHz.
- **External Clock Source Operation (EC Mode):**  
If the on-chip oscillator is not used, the EC mode allows the internal oscillator to be bypassed. The device clocks are generated from an external source (0 MHz to up to 64 MHz) and input on the OSCI pin.

## 9.4 Internal Fast RC (FRC) Oscillator

The dsPIC33CK64MC105 family devices contain one instance of the internal Fast RC (FRC) Oscillator and it provides a nominal 8 MHz clock without requiring an external crystal or ceramic resonator, which results in system cost savings for applications that do not require a precise clock reference.

The application software can tune the frequency of the oscillator using the FRC Oscillator Tuning bits (TUN[5:0]) in the FRC Oscillator Tuning register (OSCTUN[5:0]).

## 9.5 Low-Power RC (LPRC) Oscillator

The dsPIC33CK64MC105 family devices contain one instance of the Low-Power RC (LPRC) Oscillator, which provides a nominal clock frequency of 32 kHz, and is the clock source for the Watchdog Timer (WDT) and Fail-Safe Clock Monitor (FSCM) circuits in the clock subsystem. The LPRC Oscillator is shut off in Sleep mode.

The LPRC Oscillator remains enabled under these conditions:

- The FSCM is enabled
- The WDT is enabled
- The LPRC Oscillator is selected as the system clock

## 9.6 Backup Internal Fast RC (BFRC) Oscillator

The oscillator block provides a stable reference clock source for the Fail-Safe Clock Monitor (FSCM). When FSCM is enabled in the FCKSM[1:0] Configuration bits (FOSC[7:6]), it constantly monitors the main clock source against a reference signal from the 8 MHz Backup Internal Fast RC (BFRC) Oscillator. In case of a clock failure, the Fail-Safe Clock Monitor switches the clock to the BFRC Oscillator, allowing for continued low-speed operation or a safe application shutdown.

## 9.7 Reference Clock Output

In addition to the CLKO output (Fosc/2), the dsPIC33CK64MC105 family devices can be configured to provide a reference clock output signal to a port pin. This feature is available in all oscillator configurations and allows the user to select a greater range of clock sub-multiples to drive external devices in the application. CLKO is enabled by Configuration bit, OSCIOFNC, and is independent of the REFCLKO reference clock. REFCLKO is mappable to any I/O pin that has mapped output capability. Refer to [Table 8-7](#) for more information. The Reference Clock Output module block diagram is shown in [Figure 9-5](#).

**FIGURE 9-5: REFERENCE CLOCK GENERATOR**

# dsPIC33CK64MC105 FAMILY

---

This reference clock output is controlled by the REFOCONL and REFOCONH registers. Setting the ROEN bit (REFOCONL[15]) makes the clock signal available on the REFCLKO pin. The RODIV[14:0] bits (REFOCONH[14:0]) and ROTRIM[8:0] bits (REFOTRIMH[15:7]) enable the selection of different clock divider options. The formula for determining the final frequency output is shown in Equation 9-3. The ROSWEN bit (REFOCONL[9]) indicates that the clock divider has been successfully switched. In order to switch the REFCLKO divider, the user should ensure that this bit reads as '0'. Write the updated values to the RODIV[14:0] or ROTRIM[8:0] bits, set the ROSWEN bit and then wait until it is cleared before assuming that the REFCLKO clock is valid.

## EQUATION 9-3: CALCULATING FREQUENCY OUTPUT

$$F_{REFOUT} = \frac{F_{REFIN}}{2 \cdot (RODIV[14:0] + ROTRIM[8:0]/512)}$$

Where:  $F_{REFOUT}$  = Output Frequency  
 $F_{REFIN}$  = Input Frequency  
When  $RODIV[14:0] = 0$ , the output clock is the same as the input clock.

The ROSEL[3:0] bits (REFOCONL[3:0]) determine which clock source is used for the reference clock output. The ROSLP bit (REFOCONL[11]) determines if the reference source is available on REFCLKO when the device is in Sleep mode.

To use the reference clock output in Sleep mode, both the ROSLP bit must be set and the clock selected by the ROSEL[3:0] bits must be enabled for operation during Sleep mode, if possible. Clearing the ROSEL[3:0] bits allows the reference output frequency to change, as the system clock changes, during any clock switches. The ROOUT bit enables/disables the reference clock output on the REFCLKO pin.

The ROACTIV bit (REFOCONL[8]) indicates that the module is active; it can be cleared by disabling the module (setting ROEN to '0'). The user must not change the reference clock source, or adjust the divider when the ROACTIV bit indicates that the module is active. To avoid glitches, the user should not disable the module until the ROACTIV bit is '1'.

# dsPIC33CK64MC105 FAMILY

## 9.8 Oscillator Configuration

The oscillator system has both Configuration registers and SFRs to configure, control and monitor the system. The FOSCSEL and FOSC Configuration registers (Register 28-4 and Register 28-5, respectively) are used for initial setup.

Table 9-1 lists the configuration settings that select the device's oscillator source and operating mode at a Power-on Reset (POR).

**TABLE 9-1: CONFIGURATION BIT VALUES FOR CLOCK SELECTION**

Oscillator Source	Oscillator Mode	FNOSC[2:0] Value	POSCMD[1:0] Value
S0	Fast RC Oscillator (FRC) <sup>(1)</sup>	000	xx
S1	Fast RC Oscillator with PLL (FRCPLL) <sup>(1)</sup>	001	xx
S2	Primary Oscillator (EC) <sup>(1)</sup>	010	00
S2	Primary Oscillator (XT)	010	01
S2	Primary Oscillator (HS)	010	10
S3	Primary Oscillator with PLL (ECPLL) <sup>(1)</sup>	011	00
S3	Primary Oscillator with PLL (XTPLL)	011	01
S3	Primary Oscillator with PLL (HSPLL)	011	10
S4	Reserved	100	xx
S5	Low-Power RC Oscillator (LPRC) <sup>(1)</sup>	101	xx
S6	Backup FRC (BFRC) <sup>(1)</sup>	110	xx
S7	Fast RC Oscillator with ÷ N Divider (FRCDIVN) <sup>(1,2)</sup>	111	xx

**Note 1:** The OSCO pin function is determined by the OSCIOFNC Configuration bit.

**2:** This is the default oscillator mode for an unprogrammed (erased) device.

## 9.9 OSCCON Unlock Sequence

The OSCCON register is protected against unintended writes through a lock mechanism. The upper and lower bytes of OSCCON have their own unlock sequence, and both must be used when writing to both bytes of the register. Before OSCCON can be written to, the following unlock sequence must be used:

- Execute the unlock sequence for the OSCCON high byte.  
In two back-to-back instructions:
  - Write 0x78 to OSCCON[15:8]
  - Write 0x9A to OSCCON[15:8]
- In the instruction immediately following the unlock sequence, the OSCCON[15:8] bits can be modified.

- Execute the unlock sequence for the OSCCON low byte.

In two back-to-back instructions:

- Write 0x46 to OSCCON[7:0]
- Write 0x57 to OSCCON[7:0]

- In the instruction immediately following the unlock sequence, the OSCCON[7:0] bits can be modified.

**Note:** MPLAB<sup>®</sup> XC16 provides a built-in C language function, including the unlocking sequence to modify high and low bytes in the OSCCON register:

```
__builtin_write_OSCCONH(value)
__builtin_write_OSCCONL(value)
```

100000000 = 256/512 (0.5000 divisor added to the RODIV[14:0] value)

...

111111110 = 510/512 (0.99609375 divisor added to the RODIV[14:0] value)

111111111 = 511/512 (0.998046875 divisor added to the RODIV[14:0] value)

bit 6-0                      **Unimplemented:** Read as '0'

## 10.0 DIRECT MEMORY ACCESS (DMA) CONTROLLER

**Note 1:** This data sheet summarizes the features of the dsPIC33CK64MC105 family of devices. It is not intended to be a comprehensive reference source. For more information, refer to “**Direct Memory Access Controller (DMA)**” ([www.microchip.com/DS30009742](http://www.microchip.com/DS30009742)) in the “*dsPIC33/PIC24 Family Reference Manual*”.

The Direct Memory Access (DMA) Controller is designed to service high data throughput peripherals operating on the SFR bus, allowing them to access data memory directly and alleviating the need for CPU-intensive management. By allowing these data-intensive peripherals to share their own data path, the main data bus is also deloaded, resulting in additional power savings.

The DMA Controller functions both as a peripheral and a direct extension of the CPU. It is located on the microcontroller data bus, between the CPU and DMA-enabled peripherals, with direct access to SRAM. This partitions the SFR bus into two buses, allowing the DMA Controller access to the DMA-capable peripherals located on the new DMA SFR bus. The controller serves as an Initiator device on the DMA SFR bus, controlling data flow from DMA-capable peripherals.

The controller also monitors CPU instruction processing directly, allowing it to be aware of when the CPU requires access to peripherals on the DMA bus and automatically relinquishing control to the CPU as needed. This increases the effective bandwidth for handling data without DMA operations causing a processor Stall. This makes the controller essentially transparent to the user.

The DMA Controller has these features:

- Four Independently Programmable Channels
- Concurrent Operation with the CPU (no DMA caused Wait states)
- DMA Bus Arbitration
- Five Programmable Address modes
- Four Programmable Transfer modes
- Four Flexible Internal Data Transfer modes
- Byte or Word Support for Data Transfer
- 16-Bit Source and Destination Address Register for each Channel, Dynamically Updated and Reloadable
- 16-Bit Transaction Count Register, Dynamically Updated and Reloadable
- Upper and Lower Address Limit Registers
- Counter Half-Full Level Interrupt
- Software Triggered Transfer
- Null Write mode for Symmetric Buffer Operations

A simplified block diagram of the DMA Controller is shown in [Figure 10-1](#).

# dsPIC33CK64MC105 FAMILY

**FIGURE 10-1: DMA FUNCTIONAL BLOCK DIAGRAM**

## 10.1 Summary of DMA Operations

The DMA Controller is capable of moving data between addresses according to a number of different parameters. Each of these parameters can be independently configured for any transaction. In addition, any or all of the DMA channels can independently perform a different transaction at the same time. Transactions are classified by these parameters:

- Source and destination (SFRs and data RAM)
- Data size (byte or word)
- Trigger source
- Transfer mode (One-Shot, Repeated or Continuous)
- Addressing modes (Fixed Address or Address Blocks with or without Address Increment/Decrement)

In addition, the DMA Controller provides channel priority arbitration for all channels.

### 10.1.1 SOURCE AND DESTINATION

Using the DMA Controller, data may be moved between any two addresses in the Data Space. The SFR space (0000h to 0FFFh) or the data RAM space (1000h to 2FFFh) can serve as either the source or the destination. Data can be moved between these areas in either direction or between addresses in either area. The four different combinations are shown in [Figure 10-2](#).

If it is necessary to protect areas of data RAM, the DMA Controller allows the user to set upper and lower address boundaries for operations in the Data Space above the SFR space. The boundaries are set by the DMAH and DMAL Limit registers. If a DMA channel attempts an operation outside of the address boundaries, the transaction is terminated and an interrupt is generated.

### 10.1.2 DATA SIZE

The DMA Controller can handle both 8-bit and 16-bit transactions. Size is user-selectable using the SIZE bit (DMACHn[1]). By default, each channel is configured for word-sized transactions. When byte-sized transactions are chosen, the LSB of the source and/or destination address determines if the data represent the upper or lower byte of the data RAM location.

### 10.1.3 TRIGGER SOURCE

The DMA Controller can use 82 of the device's interrupt sources to initiate a transaction. The DMA trigger sources occur in reverse order from their natural interrupt priority and are shown in [Table 10-1](#).

Since the source and destination addresses for any transaction can be programmed independently of the trigger source, the DMA Controller can use any trigger to perform an operation on any peripheral. This also allows DMA channels to be cascaded to perform more complex transfer operations.

### 10.1.4 TRANSFER MODE

The DMA Controller supports four types of data transfers, based on the volume of data to be moved for each trigger.

- One-Shot: A single transaction occurs for each trigger.
- Continuous: A series of back-to-back transactions occur for each trigger; the number of transactions is determined by the DMACNTn transaction counter.
- Repeated One-Shot: A single transaction is performed repeatedly, once per trigger, until the DMA channel is disabled.
- Repeated Continuous: A series of transactions are performed repeatedly, one cycle per trigger, until the DMA channel is disabled.

All transfer modes allow the option to have the source and destination addresses, and counter value, automatically reloaded after the completion of a transaction.

### 10.1.5 ADDRESSING MODES

The DMA Controller also supports transfers between single addresses or address ranges. The four basic options are:

- Fixed-to-Fixed: Between two constant addresses
- Fixed-to-Block: From a constant source address to a range of destination addresses
- Block-to-Fixed: From a range of source addresses to a single, constant destination address
- Block-to-Block: From a range of source addresses to a range of destination addresses

The option to select auto-increment or auto-decrement of source and/or destination addresses is available for Block Addressing modes.

# dsPIC33CK64MC105 FAMILY

FIGURE 10-2: TYPES OF DMA DATA TRANSFERS

## 10.1.6 CHANNEL PRIORITY

Each DMA channel functions independently of the others, but also competes with the others for access to the data and DMA buses. When access collisions occur, the DMA Controller arbitrates between the channels using a user-selectable priority scheme. Two schemes are available:

- Round Robin: When two or more channels collide, the lower numbered channel receives priority on the first collision. On subsequent collisions, the higher numbered channels each receive priority based on their channel number.
- Fixed: When two or more channels collide, the lowest numbered channel always receives priority, regardless of past history; however, any channel being actively processed is not available for an immediate retrigger. If a higher priority channel is continually requesting service, it will be scheduled for service after the next lower priority channel with a pending request.

## 10.2 Typical Setup

To set up a DMA channel for a basic data transfer:

1. Enable the DMA Controller (DMAEN = 1) and select an appropriate channel priority scheme by setting or clearing PRSSEL.
2. Program DMAH and DMAL with appropriate upper and lower address boundaries for data RAM operations.
3. Select the DMA channel to be used and disable its operation (CHEN = 0).
4. Program the appropriate source and destination addresses for the transaction into the channel's DMASRCn and DMADSTn registers.
5. Program the DMACNTn register for the number of triggers per transfer (One-Shot or Continuous modes) or the number of words (bytes) to be transferred (Repeated modes).
6. Set or clear the SIZE bit to select the data size.
7. Program the TRMODE[1:0] bits to select the Data Transfer mode.
8. Program the SAMODE[1:0] and DAMODE[1:0] bits to select the addressing mode.
9. Enable the DMA channel by setting CHEN.
10. Enable the trigger source interrupt.

## 10.3 Peripheral Module Disable

The channels of the DMA Controller can be individually powered down using the Peripheral Module Disable (PMD) registers.

## 10.4 Registers

The DMA Controller uses a number of registers to control its operation. The number of registers depends on the number of channels implemented for a particular device.

There are always four module-level registers (one control and three buffer/address):

- DMACON: DMA Engine Control Register ([Register 10-1](#))
- DMAH and DMAL: DMA High and Low Address Limit Registers
- DMABUF: DMA Transfer Data Buffer

Each of the DMA channels implements five registers (two control and three buffer/address):

- DMACHn: DMA Channel n Control Register ([Register 10-2](#))
- DMAINTn: DMA Channel n Interrupt Register ([Register 10-3](#))
- DMASRCn: DMA Data Source Address for Channel n Register
- DMADSTn: DMA Data Destination Address for Channel n Register
- DMACNTn: DMA Transaction Counter for Channel n Register

For dsPIC33CK64MC105 devices, there are a total of 34 registers.

NOTES:

## 11.0 HIGH-RESOLUTION PWM

**Note 1:** This data sheet summarizes the features of the dsPIC33CK64MC105 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “**High-Resolution PWM with Fine Edge Placement**” ([www.microchip.com/DS70005320](http://www.microchip.com/DS70005320)) in the “dsPIC33/PIC24 Family Reference Manual”.

The High-Resolution PWM (HRPWM) module is a Pulse-Width Modulation (PWM) module to support both motor control and power supply applications. This flexible module provides features to support many types of Motor Control (MC) and Power Control (PC) applications, including:

- AC-to-DC Converters
- DC-to-DC Converters
- AC and DC Motors: BLDC, PMSM, ACIM, SRM, etc.
- Inverters
- Battery Chargers
- Digital Lighting
- Power Factor Correction (PFC)

**Note:** The Fine Edge Placement feature is not available in this family of devices.

## 11.1 Features

- Four Independent PWM Generators, each with Dual Outputs
- Operating modes:
  - Independent Edge mode
  - Variable Phase PWM mode
  - Center-Aligned mode
  - Double Update Center-Aligned mode
  - Dual Edge Center-Aligned mode
  - Dual PWM mode
- Output modes:
  - Complementary
  - Independent
  - Push-Pull
- Dead-Time Generator
- Leading-Edge Blanking (LEB)
- Output Override for Fault Handling
- Flexible Period/Duty Cycle Updating Options
- Programmable Control Inputs (PCI)
- Advanced Triggering Options
- Six Combinatorial Logic Outputs
- Six PWM Event Outputs

# dsPIC33CK64MC105 FAMILY

## 11.2 Architecture Overview

The PWM module consists of a common set of controls and features, and multiple instantiations of PWM Generators (PGs). Each PWM Generator can be independently configured or multiple PWM Generators can

be used to achieve complex multiphase systems. PWM Generators can also be used to implement sophisticated triggering, protection and logic functions. A high-level block diagram is shown in Figure 11-1.

FIGURE 11-1: PWM HIGH-LEVEL BLOCK DIAGRAM

## 11.3 PWM4H Output on PPS

All devices support the capability to output a PWM4H signal via PPS on to any "RPn" pin. This feature is intended for lower pin count devices that do not have PWM4H on a dedicated pin. If PWM4H PPS output functions are used on 48-pin devices that also have a fixed RP65/PWM4H/RD1 pin, the output signal will be present on both the dedicated and "RPn" pins. The PWM4L/H Output Port Enable bits, PENH and PENL (PG4IOCONH[3:2]), control both dedicated and PPS pins together; it is not possible to disable the dedicated pin and use only PPS.

Given the natural priority of the "RPn" functions above that of the PWM, it is possible to use the PPS output functions on the dedicated RP65/PWM4H/RD1 pin while the PWM4H signal is routed to other pins via PPS.

## 11.4 Write Restrictions

The LOCK bit (PCLKCON[8]) may be set in software to block writes to certain registers. For more information, refer to "**High-Resolution PWM with Fine Edge Placement**" ([www.microchip.com/DS70005320](http://www.microchip.com/DS70005320)) in the "*dsPIC33/PIC24 Family Reference Manual*".

The following lock/unlock sequence is required to set or clear the LOCK bit:

1. Write 0x55 to NVMKEY.
2. Write 0xAA to NVMKEY.
3. Clear (or set) the LOCK bit (PCLKCON[8]) as a single operation.

In general, modifications to configuration controls should not be done while the module is running, as indicated by the ON bit (PGxCONL[15]) being set.

# dsPIC33CK64MC105 FAMILY

## 11.5 Control Registers

There are two categories of Special Function Registers (SFRs) used to control the operation of the PWM module:

- Common, shared by all PWM Generators
- PWM Generator-specific

An 'x' in the register name denotes an instance of a PWM Generator.

A 'y' in the register name denotes an instance of the common function.

### REGISTER 11-1: PCLKCON: PWM CLOCK CONTROL REGISTER

U-0	U-0	U-0	U-0	U-0	U-0	U-0	R/W-0

1 = PWM Data register update is pending – user Data registers are not writable  
0 = No PWM Data register update is pending
- bit 3      **UPDREQ:** PWM Data Register Update Request bit  
User software writes a '1' to this bit location to request a PWM Data register update. The bit location always reads as '0'. The UPDATE status bit will indicate '1' when an update is pending.
- bit 2      **STEER:** Output Steering Status bit (Push-Pull Output mode only)  
1 = PWM Generator is in 2nd cycle of Push-Pull mode  
0 = PWM Generator is in 1st cycle of Push-Pull mode
- bit 1      **CAHALF:** Half Cycle Status bit (Center-Aligned modes only)  
1 = PWM Generator is in 2nd half of time base cycle  
0 = PWM Generator is in 1st half of time base cycle
- bit 0      **TRIG:** PWM Trigger Status bit  
1 = PWM Generator is triggered and PWM cycle is in progress  
0 = No PWM cycle is in progress

**Note 1:** User software may write a '1' to CAP as a request to initiate a software capture. The CAP status bit will be set when the capture event has occurred. No further captures will occur until CAP is cleared by software.

- bit 15     **CLMOD:** Current Limit Mode Select bit  
1 = If PCI current limit is active, then the PWMxH and PWMxL output signals are inverted (bit flipping), and the CLDAT[1:0] bits are not used  
0 = If PCI current limit is active, then the CLDAT[1:0] bits define the PWM output levels
- bit 14     **SWAP:** Swap PWM Signals to PWMxH and PWMxL Device Pins bit  
1 = The PWMxH signal is connected to the PWMxL pin and the PWMxL signal is connected to the PWMxH pin  
0 = PWMxH/L signals are mapped to their respective pins
- bit 13     **OVRENH:** User Override Enable for PWMxH Pin bit  
1 = OVRDAT1 provides data for output on the PWMxH pin  
0 = PWM Generator provides data for the PWMxH pin
- bit 12     **OVRENL:** User Override Enable for PWMxL Pin bit  
1 = OVRDAT0 provides data for output on the PWMxL pin  
0 = PWM Generator provides data for the PWMxL pin
- bit 11-10   **OVRDAT[1:0]:** Data for PWMxH/PWMxL Pins if Override is Enabled bits  
If OVRRENH = 1, then OVRDAT1 provides data for PWMxH.  
If OVRRENL = 1, then OVRDAT0 provides data for PWMxL.
- bit 9-8     **OSYNC[1:0]:** User Output Override Synchronization Control bits  
11 = Reserved  
10 = User output overrides via the OVRRENH/L and OVRDAT[1:0] bits occur when specified by the UPDMOD[2:0] bits in the PGxCONH register  
01 = User output overrides via the OVRRENH/L and OVRDAT[1:0] bits occur immediately (as soon as possible)  
00 = User output overrides via the OVRRENH/L and OVRDAT[1:0] bits are synchronized to the local PWM time base (next Start-of-Cycle)
- bit 7-6     **FLTDAT[1:0]:** Data for PWMxH/PWMxL Pins if Fault Event is Active bits  
If Fault is active, then FLTDAT1 provides data for PWMxH.  
If Fault is active, then FLTDAT0 provides data for PWMxL.
- bit 5-4     **CLDAT[1:0]:** Data for PWMxH/PWMxL Pins if Current Limit Event is Active bits  
If current limit is active, then CLDAT1 provides data for PWMxH.  
If current limit is active, then CLDAT0 provides data for PWMxL.
- bit 3-2     **FFDAT[1:0]:** Data for PWMxH/PWMxL Pins if Feed-Forward Event is Active bits  
If feed-forward is active, then FFDAT1 provides data for PWMxH.  
If feed-forward is active, then FFDAT0 provides data for PWMxL.
- bit 1-0     **DBDAT[1:0]:** Data for PWMxH/PWMxL Pins if Debug Mode is Active bits  
If Debug mode is active and device halted, then DBDAT1 provides data for PWMxH.  
If Debug mode is active and device halted, then DBDAT0 provides data for PWMxL.

NOTES:

## 12.0 HIGH-SPEED, 12-BIT ANALOG-TO-DIGITAL CONVERTER (ADC)

**Note 1:** This data sheet summarizes the features of the dsPIC33CK64MC105 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “**12-Bit High-Speed, Multiple SARs A/D Converter (ADC)**” ([www.microchip.com/DS70005213](http://www.microchip.com/DS70005213)) in the “dsPIC33/PIC24 Family Reference Manual”.

**2:** Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The dsPIC33CK64MC105 devices have a high-speed, 12-bit Analog-to-Digital Converter (ADC) that features a low conversion latency, high resolution and over-sampling capabilities to improve performance in AC/DC, DC/DC power converters. The devices implement the ADC with one shared SAR core.

The number of available channels and negative inputs is dependent on package size, as shown in [Table 12-1](#).

**TABLE 12-1: ADC EXTERNAL INPUT AVAILABILITY**

Package Type	External Inputs	Negative Inputs
48-pin	AN0-AN15 <sup>(1)</sup>	ANNO
36-pin	AN0-AN15 <sup>(1)</sup>	—
28-pin	AN0-AN11 <sup>(1)</sup>	—

**Note 1:** AN1 and AN7 are connected to the same input device pin.

## 12.1 ADC Features Overview

The High-Speed, 12-Bit Multiple SARs Analog-to-Digital Converter (ADC) includes the following features:

- One Shared (common) Core
- User-Configurable Resolution of up to 12 Bits for Each Core
- Up to 3.5 Msps Conversion Rate per Channel at 12-Bit Resolution
- Low-Latency Conversion
- Up to 16 Analog Input Channels with a Separate 16-Bit Conversion Result Register for Each Input – AN1 and AN7 Share the Same Pin
- Conversion Result can be Formatted as Unsigned or Signed Data, on a per Channel Basis, for All Channels
- Channel Scan Capability
- Multiple Conversion Trigger Options for each Core, including:
  - PWM triggers from CPU cores
  - SCCP modules triggers
  - CLC modules triggers
  - External pin trigger event (ADTRG31)
  - Software trigger
- Four Integrated Digital Comparators with Dedicated Interrupts:
  - Multiple comparison options
  - Assignable to specific analog inputs
- Four Oversampling Filters with Dedicated Interrupts:
  - Provide increased resolution
  - Assignable to a specific analog input

The module consists of one shared SAR ADC core. Simplified block diagrams of the Multiple SARs 12-Bit ADC are shown in [Figure 12-1](#) and [Figure 12-2](#).

The analog inputs (channels) are connected through multiplexers and switches to the Sample-and-Hold (S&H) circuit of each ADC core. The core uses the channel information (the output format, the Measurement mode and the input number) to process the analog sample. When conversion is complete, the result is stored in the result buffer for the specific analog input, and passed to the digital filter and digital comparator if they were configured to use data from this particular channel.

If multiple ADC inputs request conversion on the shared core, the module will convert them in a sequential manner, starting with the lowest order input.

The ADC provides each analog input the ability to specify its own trigger source. This capability allows the ADC to sample and convert analog inputs that are associated with PWM Generators operating on independent time bases.

---

## 12.2 Temperature Sensor

The ADC channel, AN16, is connected to a forward-biased diode. It can be used to measure a die temperature. This diode provides an output with a temperature coefficient of approximately -1.5 mV/C that can be monitored by the ADC. To get the exact gain and offset numbers, the two temperature points calibration is recommended.

## 12.3 Analog-to-Digital Converter Resources

Many useful resources are provided on the main product page of the Microchip website for the devices listed in this data sheet. This product page contains the latest updates and additional information.

## 12.4 Differential-Mode

ANNx negative external inputs are used for Differential-mode, as shown in [Figure 12-2](#). To enable Differential-mode, the DIFF bit (in the ADMODxL or ADMODxH register) is set for the corresponding channel.

NOTES:

## 13.0 HIGH-SPEED ANALOG COMPARATOR WITH SLOPE COMPENSATION DAC

**Note 1:** This data sheet summarizes the features of the dsPIC33CK64MC105 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “**High-Speed Analog Comparator Module**” ([www.microchip.com/DS70005280](http://www.microchip.com/DS70005280)) in the “*dsPIC33/PIC24 Family Reference Manual*”.

The high-speed analog comparator module provides a method to monitor voltage, current and other critical signals in a power conversion application that may be too fast for the CPU and ADC to capture. There are a total of three comparator modules. The analog comparator module can be used to implement Peak Current mode control, Critical Conduction mode (variable frequency) and Hysteretic Control mode.

### 13.1 Overview

The high-speed analog comparator module is comprised of a high-speed comparator, Pulse Density Modulation (PDM) DAC and a slope compensation unit. The slope compensation unit provides a user-defined slope which can be used to alter the DAC output. This feature is useful in applications, such as Peak Current mode control, where slope compensation is required to maintain the stability of the power supply. The user simply specifies the direction and rate of change for the slope compensation and the output of the DAC is modified accordingly.

The DAC consists of a PDM unit, followed by a digitally controlled multiphase RC filter. The PDM unit uses a phase accumulator circuit to generate an output stream of pulses. The density of the pulse stream is proportional to the input data value, relative to the maximum value supported by the bit width of the accumulator. The output pulse density is representative of the desired output voltage. The pulse stream is filtered with an RC filter to yield an analog voltage. The output of the DAC is connected to the negative input of the comparator. The positive input of the comparator can be selected using a MUX from either of the input pins. The comparator provides a high-speed operation with a typical delay of 15 ns.

The output of the comparator is processed by the pulse stretcher and the digital filter blocks, which prevent comparator response to unintended fast transients in the inputs. [Figure 13-1](#) shows a block diagram of the high-speed analog comparator module. The DAC module can be operated in one of three modes: Slope Generation mode, Hysteretic mode and Triangle Wave mode. Each of these modes can be used in a variety of power supply applications.

**Note:** The DACOUT pin can only be associated with a single DAC output at any given time. If more than one DACOEN bit is set, the DACOUT pin will be a combination of the signals.

# dsPIC33CK64MC105 FAMILY

FIGURE 13-1: HIGH-SPEED ANALOG COMPARATOR MODULE BLOCK DIAGRAM

## 13.2 Features Overview

- Three Rail-to-Rail Analog Comparators
- Up to Four Selectable Input Sources per Comparator
- Programmable Comparator Hysteresis
- Programmable Output Polarity
- Interrupt Generation Capability
- Dedicated Pulse Density Modulation DAC for Each Analog Comparator:
  - PDM unit followed by a digitally controlled multimode multipole RC filter
- Multimode Multipole RC Output Filter:
  - Transition mode: Provides the fastest response
  - Fast mode: For tracking DAC slopes
  - Steady-State mode: Provides 12-bit resolution
- Slope Compensation along with Each DAC:
  - Slope Generation mode
  - Hysteretic Control mode
  - Triangle Wave mode
- Functional Support for the High-Speed PWM module which Includes:
  - PWM duty cycle control
  - PWM period control
  - PWM Fault detect

## 13.3 Control Registers

The DACCTRL1L and DACCTRL2H/L registers are common configuration registers for DAC modules.

The DACxCON, DACxDAT, SLPxCON and SLPxDAT registers specify the operation of individual modules.

NOTES:

## 14.0 QUADRATURE ENCODER INTERFACE (QEI)

**Note 1:** This data sheet summarizes the features of the dsPIC33CK64MC105 family of devices. It is not intended to be a comprehensive resource. For more information, refer to “**Quadrature Encoder Interface (QEI)**” ([www.microchip.com/DS70000601](http://www.microchip.com/DS70000601)) in the “*dsPIC33/PIC24 Family Reference Manual*”.

The Quadrature Encoder Interface (QEI) module provides the interface to incremental encoders for obtaining mechanical position data. The dsPIC33CK64MC105 family implements one instance of the QEI. Quadrature Encoders, also known as incremental encoders or optical encoders, detect position and speed of rotating motion systems. Quadrature Encoders enable closed-loop control of motor control applications, such as Switched Reluctance (SR) and AC Induction Motors (ACIM).

A typical Quadrature Encoder includes a slotted wheel attached to the shaft of the motor and an emitter/detector module that senses the slots in the wheel. Typically, three output channels, Phase A (QEAX),

Phase B (QEBx) and Index (INDXx), provide information on the movement of the motor shaft, including distance and direction.

The two channels, Phase A (QEAX) and Phase B (QEBx), are typically 90 degrees out of phase with respect to each other. The Phase A and Phase B channels have a unique relationship. If Phase A leads Phase B, the direction of the motor is deemed positive or forward. If Phase A lags Phase B, the direction of the motor is deemed negative or reverse. The Index pulse occurs once per mechanical revolution and is used as a reference to indicate an absolute position. [Figure 14-1](#) illustrates the Quadrature Encoder Interface signals.

The Quadrature signals from the encoder can have four unique states ('01', '00', '10' and '11') that reflect the relationship between QEAX and QEBx. [Figure 14-1](#) illustrates these states for one count cycle. The order of the states get reversed when the direction of travel changes.

The Quadrature Decoder increments or decrements the 32-bit up/down Position x Counter (POSxCNTH/L) registers for each Change-of-State (COS). The counter increments when QEAX leads QEBx and decrements when QEBx leads QEAX.

**FIGURE 14-1: QUADRATURE ENCODER INTERFACE SIGNALS**

# dsPIC33CK64MC105 FAMILY

Table 14-1 shows the truth table that describes how the Quadrature signals are decoded.

**TABLE 14-1: TRUTH TABLE FOR QUADRATURE ENCODER**

Current Quadrature State		Previous Quadrature State		Action
QEA	QEB	QEA	QEB	
1	1	1	1	No count or direction change
1	1	1	0	Count up
1	1	0	1	Count down
1	1	0	0	Invalid state change; ignore
1	0	1	1	Count down
1	0	1	0	No count or direction change
1	0	0	1	Invalid state change; ignore
1	0	0	0	Count up
0	1	1	1	Count up
0	1	1	0	Invalid state change; ignore
0	1	0	1	No count or direction change
0	1	0	0	Count down
0	0	1	1	Invalid state change; ignore
0	0	1	0	Count down
0	0	0	1	Count up
0	0	0	0	No count or direction change

Figure 14-2 illustrates the simplified block diagram of the QEI module. The QEI module consists of decoder logic to interpret the Phase A (QEAx) and Phase B (QEBx) signals, and an up/down counter to accumulate the count. The counter pulses are generated when the Quadrature state changes. The count direction information must be maintained in a register until a direction change is detected. The module also includes digital noise filters, which condition the input signal.

The QEI module consists of the following major features:

- Four Input Pins: Two Phase Signals, an Index Pulse and a Home Pulse
- Programmable Digital Noise Filters on Inputs
- Quadrature Decoder providing Counter Pulses and Count Direction
- Count Direction Status
- 4x Count Resolution
- Index (INDXx) Pulse to Reset the Position Counter
- General Purpose 32-Bit Timer/Counter mode
- Interrupts generated by QEI or Counter Events
- 32-Bit Velocity Counter
- 32-Bit Position Counter
- 32-Bit Index Pulse Counter
- 32-Bit Interval Timer
- 32-Bit Position Initialization/Capture Register
- 32-Bit Compare Less Than and Greater Than Registers
- External Up/Down Count mode
- External Gated Count mode
- External Gated Timer mode
- Interval Timer mode

**Note 1:** These registers map to the same memory location.

# dsPIC33CK64MC105 FAMILY

## 14.1 QEI Control/Status Registers

**REGISTER 14-1: QEIXCON: QEIX CONTROL REGISTER**

R/W-0	U-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
QEIEN	—	QEISIDL	PIMOD2 <sup>(1,5)</sup>	PIMOD1 <sup>(1,5)</sup>	PIMOD0 <sup>(1,5)</sup>	IMV1 <sup>(2)</sup>	IMV0 <sup>(2)</sup>
bit 15							bit 8

U-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
—	INTDIV2 <sup>(3)</sup>	INTDIV1 <sup>(3)</sup>	INTDIV0 <sup>(3)</sup>	CNTPOL	GATEN	CCM1	CCM0
bit 7							bit 0

**Legend:**

R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared
		x = Bit is unknown

- bit 15      **QEIEN:** Quadrature Encoder Interface Module Enable bit  
             1 = Module counters are enabled  
             0 = Module counters are disabled, but SFRs can be read or written
- bit 14      **Unimplemented:** Read as '0'
- bit 13      **QEISIDL:** QEI Stop in Idle Mode bit  
             1 = Discontinues module operation when device enters Idle mode  
             0 = Continues module operation in Idle mode
- bit 12-10   **PIMOD[2:0]:** Position Counter Initialization Mode Select bits<sup>(1,5)</sup>  
             111 = Modulo Count mode for position counter and every Index event resets the position counter<sup>(4)</sup>  
             110 = Modulo Count mode for position counter  
             101 = Resets the position counter when the position counter equals the QEIXGEC register  
             100 = Second Index event after Home event initializes position counter with contents of QEIXIC register  
             011 = First Index event after Home event initializes position counter with contents of QEIXIC register  
             010 = Next Index input event initializes the position counter with contents of QEIXIC register  
             001 = Every Index input event resets the position counter  
             000 = Index input event does not affect the position counter
- bit 9-8     **IMV[1:0]:** Index Match Value bits<sup>(2)</sup>  
             11 = Index match occurs when QEBx = 1 and QEAx = 1  
             10 = Index match occurs when QEBx = 1 and QEAx = 0  
             01 = Index match occurs when QEBx = 0 and QEAx = 1  
             00 = Index match occurs when QEBx = 0 and QEAx = 0
- bit 7       **Unimplemented:** Read as '0'

- Note 1:** When CCMx = 10 or CCMx = 11, all of the QEI counters operate as timers and the PIMOD[2:0] bits are ignored.
- 2:** When CCMx = 00, and QEAx and QEBx values match the Index Match Value (IMV), the POSxCNTH and POSxCNTL registers are reset.
- 3:** The selected clock rate should be at least twice the expected maximum quadrature count rate.
- 4:** Not all devices support this mode.
- 5:** The QCAPEN and HCAPEN bits must be cleared during PIMODx Modes 2 through 7 to ensure proper functionality. Not all devices support HCAPEN.

## REGISTER 14-1: QEIXCON: QEIX CONTROL REGISTER (CONTINUED)

- bit 6-4     **INTDIV[2:0]**: Timer Input Clock Prescale Select bits<sup>(3)</sup>  
(interval timer, main timer (position counter), velocity counter and Index counter internal clock divider select)  
111 = 1:256 prescale value  
110 = 1:64 prescale value  
101 = 1:32 prescale value  
100 = 1:16 prescale value  
011 = 1:8 prescale value  
010 = 1:4 prescale value  
001 = 1:2 prescale value  
000 = 1:1 prescale value
- bit 3       **CNTPOL**: Position and Index Counter/Timer Direction Select bit  
1 = Counter direction is negative unless modified by external up/down signal  
0 = Counter direction is positive unless modified by external up/down signal
- bit 2       **GATEN**: External Count Gate Enable bit  
1 = External gate signal controls position counter operation  
0 = External gate signal does not affect position counter operation
- bit 1-0     **CCM[1:0]**: Counter Control Mode Selection bits  
11 = Internal Timer mode  
10 = External Clock Count with External Gate mode  
01 = External Clock Count with External Up/Down mode  
00 = Quadrature Encoder mode

- Note 1:** When CCMx = 10 or CCMx = 11, all of the QEI counters operate as timers and the PIMOD[2:0] bits are ignored.
- 2:** When CCMx = 00, and QEAx and QEBx values match the Index Match Value (IMV), the POSxCNTH and POSxCNTL registers are reset.
- 3:** The selected clock rate should be at least twice the expected maximum quadrature count rate.
- 4:** Not all devices support this mode.
- 5:** The QCAPEN and HCAPEN bits must be cleared during PIMODx Modes 2 through 7 to ensure proper functionality. Not all devices support HCAPEN.

## 15.0 UNIVERSAL ASYNCHRONOUS RECEIVER TRANSMITTER (UART)

**Note 1:** This data sheet summarizes the features of the dsPIC33CK64MC105 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “**Multiprotocol Universal Asynchronous Receiver Transmitter (UART) Module**” ([www.microchip.com/DS70005288](http://www.microchip.com/DS70005288)) in the “*dsPIC33/PIC24 Family Reference Manual*”.

The Universal Asynchronous Receiver Transmitter (UART) is a flexible serial communication peripheral used to interface dsPIC® microcontrollers with other equipment, including computers and peripherals. The UART is a full-duplex, asynchronous communication channel that can be used to implement protocols, such as RS-232 and RS-485. The UART also supports the following hardware extensions:

- LIN/J2602
- IrDA®
- Direct Matrix Architecture (DMX)
- Smart Card

The primary features of the UART are:

- Full or Half-Duplex Operation
- Up to 8-Deep TX and RX First In, First Out (FIFO) Buffers
- 8-Bit or 9-Bit Data Width
- Configurable Stop Bit Length
- Flow Control
- Auto-Baud Calibration
- Parity, Framing and Buffer Overrun Error Detection
- Address Detect
- Break Transmission
- Transmit and Receive Polarity Control
- Manchester Encoder/Decoder
- Operation in Sleep mode
- Wake from Sleep on Sync Break Received Interrupt

# dsPIC33CK64MC105 FAMILY

## 15.1 Architectural Overview

The UART transfers bytes of data, to and from device pins, using First-In First-Out (FIFO) buffers up to eight bytes deep. The status of the buffers and data is made available to user software through Special Function

Registers (SFRs). The UART implements multiple interrupt channels for handling transmit, receive and error events. A simplified block diagram of the UART is shown in [Figure 15-1](#).

**FIGURE 15-1: SIMPLIFIED UARTx BLOCK DIAGRAM**

## 15.2 Character Frame

A typical UART character frame is shown in [Figure 15-2](#). The Idle state is high with a 'Start' condition indicated by a falling edge. The Start bit is followed by the number of data, parity/address detect and Stop bits defined by the MOD[3:0] (UxMODE[3:0]) bits selected.

**FIGURE 15-2: UART CHARACTER FRAME**

## 15.3 Data Buffers

Both transmit and receive functions use buffers to store data shifted to/from the pins. These buffers are FIFOs and are accessed by reading the SFRs, UxTXREG and UxRXREG, respectively. Each data buffer has multiple flags associated with its operation to allow software to read the status. Interrupts can also be configured based on the space available in the buffers. The transmit and receive buffers can be cleared and their pointers reset using the associated TX/RX Buffer Empty Status bits, UTXBE (UxSTAH[5]) and URXBE (UxSTAH[1]).

## 15.4 Protocol Extensions

The UART provides hardware support for LIN/J2602, IrDA<sup>®</sup>, DMX and smart card protocol extensions to reduce software overhead. A protocol extension is enabled by writing a value to the MOD[3:0] (UxMODE[3:0]) selection bits and further configured using the UARTx Timing Parameter registers, UxP1 ([Register 15-9](#)), UxP2 ([Register 15-10](#)), UxP3 ([Register 15-11](#)) and UxP3H ([Register 15-12](#)). Details regarding operation and usage are discussed in their respective chapters.

	'0' = Bit is cleared
	x = Bit is unknown

- bit 15      **UARTEN:** UART Enable bit  
 1 = UART is ready to transmit and receive  
 0 = UART state machine, FIFO Buffer Pointers and counters are reset; registers are readable and writable
- bit 14      **Unimplemented:** Read as '0'
- bit 13      **USIDL:** UART Stop in Idle Mode bit  
 1 = Discontinues module operation when device enters Idle mode  
 0 = Continues module operation in Idle mode
- bit 12      **WAKE:** Wake-up Enable bit  
 1 = Module will continue to sample the RX pin – interrupt generated on falling edge, bit cleared in hardware on following rising edge; if ABAUD is set, Auto-Baud Detection (ABD) will begin immediately  
 0 = RX pin is not monitored nor rising edge detected
- bit 11      **RXBIMD:** Receive Break Interrupt Mode bit  
 1 = RXBKIF flag when a minimum of 23 (DMX)/11 (asynchronous or LIN/J2602) low bit periods are detected  
 0 = RXBKIF flag when the Break makes a low-to-high transition after being low for at least 23/11 bit periods
- bit 10      **Unimplemented:** Read as '0'
- bit 9        **BRKOVr:** Send Break Software Override bit  
Overrides the TX Data Line:  
 1 = Makes the TX line active (Output 0 when UTXINV = 0, Output 1 when UTXINV = 1)  
 0 = TX line is driven by the shifter
- bit 8        **UTXBRK:** UART Transmit Break bit<sup>(1)</sup>  
 1 = Sends Sync Break on next transmission; cleared by hardware upon completion  
 0 = Sync Break transmission is disabled or has completed
- bit 7        **BRGH:** High Baud Rate Select bit  
 1 = High Speed: Baud rate is baudclk/4  
 0 = Low Speed: Baud rate is baudclk/16
- bit 6        **ABAUD:** Auto-Baud Detect Enable bit (read-only when MOD[3:0] = 1<sub>xxxx</sub>)  
 1 = Enables baud rate measurement on the next character – requires reception of a Sync field (55h); cleared in hardware upon completion  
 0 = Baud rate measurement is disabled or has completed

**Note 1:** R/HS/HC in DMX and LIN mode.

NOTES:

## 16.0 SERIAL PERIPHERAL INTERFACE (SPI)

**Note 1:** This data sheet summarizes the features of the dsPIC33CK64MC105 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “**Serial Peripheral Interface (SPI) with Audio Codec Support**” ([www.microchip.com/DS70005136](http://www.microchip.com/DS70005136)) in the “*dsPIC33/PIC24 Family Reference Manual*”.

The Serial Peripheral Interface (SPI) module is a synchronous serial interface, useful for communicating with other peripheral or microcontroller devices. These peripheral devices may be serial EEPROMs, shift registers, display drivers, A/D Converters, etc. The SPI module is compatible with the Motorola® SPI and SIOP interfaces. All devices in the dsPIC33CK64MC105 family include three SPI modules. On 48-pin devices, SPI instance of SPI2 can operate at higher speeds when selected as a non-PPS pin. The selection is done using the SPI2PIN bit (FDEVOPT[13]). If the bit for SPI2PIN is '1', the PPS pin will be used. When SPI2PIN is '0', the SPI signals are routed to dedicated pins.

The module supports operation in two Buffer modes. In Standard mode, data are shifted through a single serial buffer. In Enhanced Buffer mode, data are shifted through a FIFO buffer. The FIFO level depends on the configured mode.

**Note:** FIFO depth for this device is four (in 8-Bit Data mode).

Variable length data can be transmitted and received, from 2 to 32 bits.

**Note:** Do not perform Read-Modify-Write operations (such as bit-oriented instructions) on the SPIxBUF register in either Standard or Enhanced Buffer mode.

The module also supports a basic framed SPI protocol while operating in either Host or Client mode. A total of four framed SPI configurations are supported.

The module also supports Audio modes. Four different Audio modes are available.

- I<sup>2</sup>S mode
- Left Justified mode
- Right Justified mode
- PCM/DSP mode

In each of these modes, the serial clock is free-running and audio data are always transferred.

If an audio protocol data transfer takes place between two devices, then usually one device is the Host and the other is the Client. However, audio data can be transferred between two Clients. Because the audio protocols require free-running clocks, the Host can be a third-party controller. In either case, the Host generates two free-running clocks: SCKx and LRC (Left, Right Channel Clock/ $\overline{SSx}$ /FSYNC).

The SPI serial interface consists of four pins:

- SDIx: Serial Data Input
- SDOx: Serial Data Output
- SCKx: Shift Clock Input or Output
- $\overline{SSx}$ : Active-Low Client Select or Frame Synchronization I/O Pulse

The SPI module can be configured to operate using two, three or four pins. In the 3-pin mode,  $\overline{SSx}$  is not used. In the 2-pin mode, both SDOx and  $\overline{SSx}$  are not used.

# dsPIC33CK64MC105 FAMILY

---

The SPI module has the ability to generate three interrupts reflecting the events that occur during the data communication. The following types of interrupts can be generated:

1. Receive interrupts are signalled by SPIxRXIF.  
This event occurs when:
  - RX watermark interrupt
  - SPIROV = 1
  - SPIRBF = 1
  - SPIRBE = 1provided the respective mask bits are enabled in SPIxIMSKL/H.
2. Transmit interrupts are signalled by SPIxTXIF.  
This event occurs when:
  - TX watermark interrupt
  - SPITUR = 1
  - SPITBF = 1
  - SPITBE = 1provided the respective mask bits are enabled in SPIxIMSKL/H.
3. General interrupts are signalled by SPIxGIF.  
This event occurs when:
  - FRMERR = 1
  - SPIBUSY = 1
  - SRMT = 1provided the respective mask bits are enabled in SPIxIMSKL/H.

Block diagrams of the module in Standard and Enhanced modes are shown in [Figure 16-1](#) and [Figure 16-2](#).

**Note:** In this section, the SPI modules are referred to together as SPIx, or separately as SPI1, SPI2 or SPI3. Special Function Registers will follow a similar notation. For example, SPIxCON1 and SPIxCON2 refer to the control registers for any of the three SPI modules.

To set up the SPIx module for the Standard Host mode of operation:

1. If using interrupts:
  - a) Clear the interrupt flag bits in the respective IFSx register.
  - b) Set the interrupt enable bits in the respective IECx register.
  - c) Write the SPIxIP bits in the respective IPCx register to set the interrupt priority.
2. Write the desired settings to the SPIxCON1L and SPIxCON1H registers with the MSTEN bit (SPIxCON1L[5]) = 1.
3. Clear the SPIROV bit (SPIxSTATL[6]).
4. Enable SPIx operation by setting the SPIEN bit (SPIxCON1L[15]).
5. Write the data to be transmitted to the SPIxBUFL and SPIxBUFH registers. Transmission (and reception) will start as soon as data are written to the SPIxBUFL and SPIxBUFH registers.

To set up the SPIx module for the Standard Client mode of operation:

1. Clear the SPIxBUF registers.
2. If using interrupts:
  - a) Clear the SPIxBUFL and SPIxBUFH registers.
  - b) Set the interrupt enable bits in the respective IECx register.
  - c) Write the SPIxIP bits in the respective IPCx register to set the interrupt priority.
3. Write the desired settings to the SPIxCON1L, SPIxCON1H and SPIxCON2L registers with the MSTEN bit (SPIxCON1L[5]) = 0.
4. Clear the SMP bit.
5. If the CKE bit (SPIxCON1L[8]) is set, then the SSEN bit (SPIxCON1L[7]) must be set to enable the SSx pin.
6. Clear the SPIROV bit (SPIxSTATL[6]).
7. Enable SPIx operation by setting the SPIEN bit (SPIxCON1L[15]).

**FIGURE 16-1: SPIx MODULE BLOCK DIAGRAM (STANDARD MODE)**

# dsPIC33CK64MC105 FAMILY

To set up the SPIx module for the Enhanced Buffer Host mode of operation:

- If using interrupts:
  - Clear the interrupt flag bits in the respective IFSx register.
  - Set the interrupt enable bits in the respective IECx register.
  - Write the SPIxIP bits in the respective IPCx register.
- Write the desired settings to the SPIxCON1L, SPIxCON1H and SPIxCON2L registers with MSTEN (SPIxCON1L[5]) = 1.
- Clear the SPIROV bit (SPIxSTATL[6]).
- Select Enhanced Buffer mode by setting the ENHBUF bit (SPIxCON1L[0]).
- Enable SPIx operation by setting the SPIEN bit (SPIxCON1L[15]).
- Write the data to be transmitted to the SPIxBUFL and SPIxBUFH registers. Transmission (and reception) will start as soon as data are written to the SPIxBUFL and SPIxBUFH registers.

To set up the SPIx module for the Enhanced Buffer Client mode of operation:

- Clear the SPIxBUFL and SPIxBUFH registers.
- If using interrupts:
  - Clear the interrupt flag bits in the respective IFSx register.
  - Set the interrupt enable bits in the respective IECx register.
  - Write the SPIxIP bits in the respective IPCx register to set the interrupt priority.
- Write the desired settings to the SPIxCON1L, SPIxCON1H and SPIxCON2L registers with the MSTEN bit (SPIxCON1L[5]) = 0.
- Clear the SMP bit.
- If the CKE bit is set, then the SSEN bit must be set, thus enabling the  $\overline{SSx}$  pin.
- Clear the SPIROV bit (SPIxSTATL[6]).
- Select Enhanced Buffer mode by setting the ENHBUF bit (SPIxCON1L[0]).
- Enable SPIx operation by setting the SPIEN bit (SPIxCON1L[15]).

**FIGURE 16-2: SPIx MODULE BLOCK DIAGRAM (ENHANCED MODE)**

# dsPIC33CK64MC105 FAMILY

---

To set up the SPIx module for Audio mode:

1. Clear the SPIxBUFL and SPIxBUFH registers.
2. If using interrupts:
  - a) Clear the interrupt flag bits in the respective IFSx register.
  - b) Set the interrupt enable bits in the respective IECx register.
  - c) Write the SPIxIP bits in the respective IPCx register to set the interrupt priority.
3. Write the desired settings to the SPIxCON1L, SPIxCON1H and SPIxCON2L registers with AUDEN (SPIxCON1H[15]) = 1.
4. Clear the SPIROV bit (SPIxSTATL[6]).
5. Enable SPIx operation by setting the SPIEN bit (SPIxCON1L[15]).
6. Write the data to be transmitted to the SPIxBUFL and SPIxBUFH registers. Transmission (and reception) will start as soon as data are written to the SPIxBUFL and SPIxBUFH registers.

**Note:** After start-up, when configured for Client mode, left justified for all possible configurations of MODE[32,16] and in right justified for MODE[32,16] = {0b00, 0b10}, the SPI drives ones out of SDOx if the MSb bit of the first data is a one.

## 16.1 SPI Control/Status Registers

**REGISTER 16-1: SPIxCON1L: SPIx CONTROL REGISTER 1 LOW**

R/W-0	U-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
SPIEN	—	SPISIDL	DISSDO	MODE32 <sup>(1,4)</sup>	MODE16 <sup>(1,4)</sup>	SMP	CKE <sup>(1)</sup>
bit 15							bit 8

R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
SSEN <sup>(2)</sup>	CKP	MSTEN	DISSDI	DISSCK	MCLKEN <sup>(3)</sup>	SPIFE	ENHBUF
bit 7							bit 0

**Legend:**

R = Readable bit                      W = Writable bit                      U = Unimplemented bit, read as '0'  
 -n = Value at POR                      '1' = Bit is set                      '0' = Bit is cleared                      x = Bit is unknown

bit 15            **SPIEN:** SPIx On bit  
                   1 = Enables module  
                   0 = Turns off and resets module, disables clocks, disables interrupt event generation, allows SFR modifications

bit 14            **Unimplemented:** Read as '0'

bit 13            **SPISIDL:** SPIx Stop in Idle Mode bit  
                   1 = Halts in CPU Idle mode  
                   0 = Continues to operate in CPU Idle mode

bit 12            **DISSDO:** Disable SDOx Output Port bit  
                   1 = SDOx pin is not used by the module; pin is controlled by port function  
                   0 = SDOx pin is controlled by the module

bit 11-10        **MODE32** and **MODE16:** Serial Word Length Select bits<sup>(1,4)</sup>

MODE32	MODE16	AUDEN	Communication
1	x	0	32-Bit
0	1		16-Bit
0	0		8-Bit
1	1	1	24-Bit Data, 32-Bit FIFO, 32-Bit Channel/64-Bit Frame
1	0		32-Bit Data, 32-Bit FIFO, 32-Bit Channel/64-Bit Frame
0	1		16-Bit Data, 16-Bit FIFO, 32-Bit Channel/64-Bit Frame
0	0		16-Bit FIFO, 16-Bit Channel/32-Bit Frame

bit 9            **SMP:** SPIx Data Input Sample Phase bit  
Host Mode:  
                   1 = Input data are sampled at the end of data output time  
                   0 = Input data are sampled at the middle of data output time  
Client Mode:  
                   Input data are always sampled at the middle of data output time, regardless of the SMP setting.

bit 8            **CKE:** SPIx Clock Edge Select bit<sup>(1)</sup>  
                   1 = Transmit happens on transition from Active Clock state to Idle Clock state  
                   0 = Transmit happens on transition from Idle Clock state to Active Clock state

- Note 1:** When AUDEN (SPIxCON1H[15]) = 1, this module functions as if CKE = 0, regardless of its actual value.  
**Note 2:** When FRMEN = 1, SSEN is not used.  
**Note 3:** MCLKEN can only be written when the SPIEN bit = 0.  
**Note 4:** This channel is not meaningful for DSP/PCM mode as LRC follows FRMSYPW.

# dsPIC33CK64MC105 FAMILY

## REGISTER 16-1: SPIxCON1L: SPIx CONTROL REGISTER 1 LOW (CONTINUED)

bit 7	<b>SSEN:</b> Client Select Enable bit (Client mode) <sup>(2)</sup> 1 = $\overline{SSx}$ pin is used by the macro in Client mode; $\overline{SSx}$ pin is used as the Client select input 0 = $\overline{SSx}$ pin is not used by the macro ( $\overline{SSx}$ pin will be controlled by the port I/O)
bit 6	<b>CKP:</b> Clock Polarity Select bit 1 = Idle state for clock is a high level; active state is a low level 0 = Idle state for clock is a low level; active state is a high level
bit 5	<b>MSTEN:</b> Master Mode Enable bit 1 = Host mode 0 = Client mode
bit 4	<b>DISSDI:</b> Disable SDIx Input Port bit 1 = SDIx pin is not used by the module; pin is controlled by port function 0 = SDIx pin is controlled by the module
bit 3	<b>DISSCK:</b> Disable SCKx Output Port bit 1 = SCKx pin is not used by the module; pin is controlled by port function 0 = SCKx pin is controlled by the module
bit 2	<b>MCLKEN:</b> Master Clock Enable bit <sup>(3)</sup> 1 = Reference Clock (REFCLKO) is used by the BRG 0 = Peripheral Clock ( $F_P = F_{OSC}/2$ ) is used by the BRG
bit 1	<b>SPIFE:</b> Frame Sync Pulse Edge Select bit 1 = Frame Sync pulse (Idle-to-active edge) coincides with the first bit clock 0 = Frame Sync pulse (Idle-to-active edge) precedes the first bit clock
bit 0	<b>ENHBUF:</b> Enhanced Buffer Enable bit 1 = Enhanced Buffer mode is enabled 0 = Enhanced Buffer mode is disabled

- Note 1:** When AUDEN (SPIxCON1H[15]) = 1, this module functions as if CKE = 0, regardless of its actual value.
- 2:** When FRMEN = 1, SSEN is not used.
- 3:** MCLKEN can only be written when the SPIEN bit = 0.
- 4:** This channel is not meaningful for DSP/PCM mode as LRC follows FRMSYPW.

## REGISTER 16-2: SPIxCON1H: SPIx CONTROL REGISTER 1 HIGH

R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
AUDEN <sup>(1)</sup>	SPISGNEXT	IGNROV	IGNTUR	AUDMONO <sup>(2)</sup>	URDTEN <sup>(3)</sup>	AUDMOD1 <sup>(4)</sup>	AUDMOD0 <sup>(4)</sup>
bit 15						bit 8	

R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
FRMEN	FRMSYNC	FRMPOL	MSEN	FRMSYPW	FRMCNT2	FRMCNT1	FRMCNT0
bit 7						bit 0	

### Legend:

R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared
		x = Bit is unknown

- bit 15      **AUDEN:** Audio Codec Support Enable bit<sup>(1)</sup>  
 1 = Audio protocol is enabled; MSTEN controls the direction of both SCKx and frame (a.k.a. LRC), and this module functions as if FRMEN = 1, FRMSYNC = MSTEN, FRMCNT[2:0] = 001 and SMP = 0, regardless of their actual values  
 0 = Audio protocol is disabled
- bit 14      **SPISGNEXT:** SPIx Sign-Extend RX FIFO Read Data Enable bit  
 1 = Data from RX FIFO are sign-extended  
 0 = Data from RX FIFO are not sign-extended
- bit 13      **IGNROV:** Ignore Receive Overflow bit  
 1 = A Receive Overflow (ROV) is NOT a critical error; during ROV, data in the FIFO are not overwritten by the receive data  
 0 = A ROV is a critical error that stops SPI operation
- bit 12      **IGNTUR:** Ignore Transmit Underrun bit  
 1 = A Transmit Underrun (TUR) is NOT a critical error and data indicated by URDTEN are transmitted until the SPIxTXB is not empty  
 0 = A TUR is a critical error that stops SPI operation
- bit 11      **AUDMONO:** Audio Data Format Transmit bit<sup>(2)</sup>  
 1 = Audio data are mono (i.e., each data word is transmitted on both left and right channels)  
 0 = Audio data are stereo
- bit 10      **URDTEN:** Transmit Underrun Data Enable bit<sup>(3)</sup>  
 1 = Transmits data out of SPIxURDT register during Transmit Underrun conditions  
 0 = Transmits the last received data during Transmit Underrun conditions
- bit 9-8      **AUDMOD[1:0]:** Audio Protocol Mode Selection bits<sup>(4)</sup>  
 11 = PCM/DSP mode  
 10 = Right Justified mode: This module functions as if SPIFE = 1, regardless of its actual value  
 01 = Left Justified mode: This module functions as if SPIFE = 1, regardless of its actual value  
 00 = I<sup>2</sup>S mode: This module functions as if SPIFE = 0, regardless of its actual value
- bit 7      **FRMEN:** Framed SPIx Support bit  
 1 = Framed SPIx support is enabled ( $\overline{SSx}$  pin is used as the FSYNC input/output)  
 0 = Framed SPIx support is disabled

- Note 1:** AUDEN can only be written when the SPIEN bit = 0.  
**Note 2:** AUDMONO can only be written when the SPIEN bit = 0 and is only valid for AUDEN = 1.  
**Note 3:** URDTEN is only valid when IGNTUR = 1.  
**Note 4:** AUDMOD[1:0] can only be written when the SPIEN bit = 0 and is only valid when AUDEN = 1. When NOT in PCM/DSP mode, this module functions as if FRMSYPW = 1, regardless of its actual value.

# dsPIC33CK64MC105 FAMILY

---

## REGISTER 16-2: SPIxCON1H: SPIx CONTROL REGISTER 1 HIGH (CONTINUED)

- bit 6      **FRMSYNC**: Frame Sync Pulse Direction Control bit  
1 = Frame Sync pulse input (Client)  
0 = Frame Sync pulse output (Host)
- bit 5      **FRMPOL**: Frame Sync/Client Select Polarity bit  
1 = Frame Sync pulse/Client select is active-high  
0 = Frame Sync pulse/Client select is active-low
- bit 4      **MSEN**: Host Mode Client Select Enable bit  
1 = SPIx Client select support is enabled with polarity determined by FRMPOL ( $\overline{SSx}$  pin is automatically driven during transmission in Host mode)  
0 = Client select SPIx support is disabled ( $\overline{SSx}$  pin will be controlled by port I/O)
- bit 3      **FRMSYPW**: Frame Sync Pulse-Width bit  
1 = Frame Sync pulse is one serial word length wide (as defined by MODE[32,16]/WLENGTH[4:0])  
0 = Frame Sync pulse is one clock (SCKx) wide
- bit 2-0    **FRMCNT[2:0]**: Frame Sync Pulse Counter bits  
Controls the number of serial words transmitted per Sync pulse.  
111 = Reserved  
110 = Reserved  
101 = Generates a Frame Sync pulse on every 32 serial words  
100 = Generates a Frame Sync pulse on every 16 serial words  
011 = Generates a Frame Sync pulse on every 8 serial words  
010 = Generates a Frame Sync pulse on every 4 serial words  
001 = Generates a Frame Sync pulse on every 2 serial words (value used by audio protocols)  
000 = Generates a Frame Sync pulse on each serial word

- Note 1:** AUDEN can only be written when the SPIEN bit = 0.  
**2:** AUDMONO can only be written when the SPIEN bit = 0 and is only valid for AUDEN = 1.  
**3:** URDTEN is only valid when IGNTUR = 1.  
**4:** AUDMOD[1:0] can only be written when the SPIEN bit = 0 and is only valid when AUDEN = 1. When NOT in PCM/DSP mode, this module functions as if FRMSYPW = 1, regardless of its actual value.

## REGISTER 16-4: SPIxSTATL: SPIx STATUS REGISTER LOW

U-0	U-0	U-0	HS/R/C-0	HSC/R-0	U-0	U-0	HSC/R-0
—	—	—	FRMERR	SPIBUSY	—	—	SPITUR <sup>(1)</sup>
bit 15							bit 8

HSC/R-0	HS/R/C-0	HSC/R-1	U-0	HSC/R-1	U-0	HSC/R-0	HSC/R-0
SRMT	SPIROV	SPIRBE	—	SPITBE	—	SPITBF	SPIRBF
bit 7							bit 0

<b>Legend:</b>	C = Clearable bit	U = Unimplemented, read as '0'
R = Readable bit	W = Writable bit	HSC = Hardware Settable/Clearable bit
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared
		HS = Hardware Settable bit

bit 15-13 **Unimplemented:** Read as '0'

bit 12 **FRMERR:** SPIx Frame Error Status bit

1 = Frame error is detected  
0 = No frame error is detected

bit 11 **SPIBUSY:** SPIx Activity Status bit

1 = Module is currently busy with some transactions  
0 = No ongoing transactions (at time of read)

bit 10-9 **Unimplemented:** Read as '0'

bit 8 **SPITUR:** SPIx Transmit Underrun Status bit<sup>(1)</sup>

1 = Transmit buffer has encountered a Transmit Underrun condition  
0 = Transmit buffer does not have a Transmit Underrun condition

bit 7 **SRMT:** Shift Register Empty Status bit

1 = No current or pending transactions (i.e., neither SPIxTXB or SPIxTXSR contains data to transmit)  
0 = Current or pending transactions

bit 6 **SPIROV:** SPIx Receive Overflow Status bit

1 = A new byte/half-word/word has been completely received when the SPIxRXB was full  
0 = No overflow

bit 5 **SPIRBE:** SPIx RX Buffer Empty Status bit

1 = RX buffer is empty  
0 = RX buffer is not empty

Standard Buffer Mode:

Automatically set in hardware when SPIxBUF is read from, reading SPIxRXB. Automatically cleared in hardware when SPIx transfers data from SPIxRXSR to SPIxRXB.

Enhanced Buffer Mode:

Indicates RXELM[5:0] = 000000.

bit 4 **Unimplemented:** Read as '0'

**Note 1:** SPITUR is cleared when SPIEN = 0. When IGNTUR = 1, SPITUR provides dynamic status of the Transmit Underrun condition, but does not stop RX/TX operation and does not need to be cleared by software.

# dsPIC33CK64MC105 FAMILY

---

## REGISTER 16-4: SPIxSTATL: SPIx STATUS REGISTER LOW (CONTINUED)

- bit 3      **SPITBE:** SPIx Transmit Buffer Empty Status bit  
1 = SPIxTXB is empty  
0 = SPIxTXB is not empty  
Standard Buffer Mode:  
Automatically set in hardware when SPIx transfers data from SPIxTXB to SPIxTXSR. Automatically cleared in hardware when SPIxBUF is written, loading SPIxTXB.  
Enhanced Buffer Mode:  
Indicates TXELM[5:0] = 000000.
- bit 2      **Unimplemented:** Read as '0'
- bit 1      **SPITBF:** SPIx Transmit Buffer Full Status bit  
1 = SPIxTXB is full  
0 = SPIxTXB not full  
Standard Buffer Mode:  
Automatically set in hardware when SPIxBUF is written, loading SPIxTXB. Automatically cleared in hardware when SPIx transfers data from SPIxTXB to SPIxTXSR.  
Enhanced Buffer Mode:  
Indicates TXELM[5:0] = 111111.
- bit 0      **SPIRBF:** SPIx Receive Buffer Full Status bit  
1 = SPIxRXB is full  
0 = SPIxRXB is not full  
Standard Buffer Mode:  
Automatically set in hardware when SPIx transfers data from SPIxRXSR to SPIxRXB. Automatically cleared in hardware when SPIxBUF is read from, reading SPIxRXB.  
Enhanced Buffer Mode:  
Indicates RXELM[5:0] = 111111.

**Note 1:** SPITUR is cleared when SPIEN = 0. When IGNTUR = 1, SPITUR provides dynamic status of the Transmit Underrun condition, but does not stop RX/TX operation and does not need to be cleared by software.

FP is the Peripheral Bus Clock Frequency.

## 17.0 INTER-INTEGRATED CIRCUIT (I<sup>2</sup>C)

**Note 1:** This data sheet summarizes the features of the dsPIC33CK64MC105 family of devices. It is not intended to be a comprehensive reference source. For more information, refer to “**Inter-Integrated Circuit (I<sup>2</sup>C)**” ([www.microchip.com/DS70000195](http://www.microchip.com/DS70000195)) in the “*dsPIC33/PIC24 Family Reference Manual*”.

The Inter-Integrated Circuit (I<sup>2</sup>C) module is a serial interface useful for communicating with other peripheral or microcontroller devices. These peripheral devices may be serial EEPROMs, display drivers, A/D Converters, etc.

The I<sup>2</sup>C module supports these features:

- Independent Host and Client Logic
- 7-Bit and 10-Bit Device Addresses
- General Call Address as Defined in the I<sup>2</sup>C Protocol
- Clock Stretching to Provide Delays for the Processor to Respond to a Client Data Request
- Both 100 kHz and 400 kHz Bus Specifications
- Configurable Address Masking
- Multi-Host modes to Prevent Loss of Messages in Arbitration
- Bus Repeater mode, Allowing the Acceptance of All Messages as a Client, regardless of the Address
- Automatic SCL

A block diagram of the module is shown in [Figure 17-1](#).

## 17.1 Communicating as a Host in a Single Host Environment

The details of sending a message in Host mode depends on the communication protocol for the device being communicated with. Typically, the sequence of events is as follows:

1. Assert a Start condition on SDAx and SCLx.
2. Send the I<sup>2</sup>C device address byte to the Client with a write indication.
3. Wait for and verify an Acknowledge from the Client.
4. Send the first data byte (sometimes known as the command) to the Client.
5. Wait for and verify an Acknowledge from the Client.
6. Send the serial memory address low byte to the Client.
7. Repeat Steps 4 and 5 until all data bytes are sent.
8. Assert a Repeated Start condition on SDAx and SCLx.
9. Send the device address byte to the Client with a read indication.
10. Wait for and verify an Acknowledge from the Client.
11. Enable Host reception to receive serial memory data.
12. Generate an ACK or NACK condition at the end of a received byte of data.
13. Generate a Stop condition on SDAx and SCLx.

FIGURE 17-1: I2Cx BLOCK DIAGRAM

## 17.2 Setting Baud Rate When Operating as a Bus Host

To compute the Baud Rate Generator reload value, use [Equation 17-1](#).

### EQUATION 17-1: COMPUTING BAUD RATE RELOAD VALUE<sup>(1,2,3,4)</sup>

$$I2CxBRG = ((1/F_{SCL} - Delay) \cdot FP/2) - 2$$

- Note 1:** Based on  $FP = F_{OSC}/2$ .
- 2:** These clock rate values are for guidance only. The actual clock rate can be affected by various system-level parameters. The actual clock rate should be measured in its intended application.
- 3:** Typical value of delay varies from 110 ns to 150 ns.
- 4:** I2CxBRG values of 0 to 3 are expressly forbidden. The user should never program the I2CxBRG with a value of 0x0, 0x1, 0x2 or 0x3 as indeterminate results may occur.

## 17.3 Client Address Masking

The I2CxMSK register ([Register 17-4](#)) designates address bit positions as “don’t care” for both 7-Bit and 10-Bit Addressing modes. Setting a particular bit location (= 1) in the I2CxMSK register causes the Client module to respond, whether the corresponding address bit value is a ‘0’ or a ‘1’. For example, when I2CxMSK is set to ‘0010000000’, the Client module will detect both addresses, ‘0000000000’ and ‘0010000000’.

To enable address masking, the Intelligent Peripheral Management Interface (IPMI) must be disabled by clearing the STRICT bit (I2CxCONL[11]).

**Note:** As a result of changes in the I<sup>2</sup>C protocol, the addresses in [Table 17-2](#) are reserved and will not be Acknowledged in Client mode. This includes any address mask settings that include any of these addresses.

**TABLE 17-1: I2Cx CLOCK RATES<sup>(1,2)</sup>**

Fcy	FSCL	I2CxBRG Value	
		Decimal	Hexadecimal
100 MHz	1 MHz	41	29
100 MHz	400 kHz	116	74
100 MHz	100 kHz	491	1EB
80 MHz	1 MHz	32	20
80 MHz	400 kHz	92	5C
80 MHz	100 kHz	392	188
60 MHz	1 MHz	24	18
60 MHz	400 kHz	69	45
60 MHz	100 kHz	294	126
40 MHz	1 MHz	15	0F
40 MHz	400 kHz	45	2D
40 MHz	100 kHz	195	C3
20 MHz	1 MHz	7	7
20 MHz	400 kHz	22	16
20 MHz	100 kHz	97	61

- Note 1:** Based on  $FP = F_{OSC}/2$ .
- 2:** These clock rate values are for guidance only. The actual clock rate can be affected by various system-level parameters. The actual clock rate should be measured in its intended application.

<b>Legend:</b>	HC = Hardware Clearable bit
R = Readable bit	W = Writable bit
-n = Value at POR	'1' = Bit is set
	U = Unimplemented bit, read as '0'
	'0' = Bit is cleared
	x = Bit is unknown

- bit 15      **I2CEN:** I2Cx Enable bit (writable from software only)  
 1 = Enables the I2Cx module, and configures the SDAx and SCLx pins as serial port pins  
 0 = Disables the I2Cx module; all I<sup>2</sup>C pins are controlled by port functions
- bit 14      **Unimplemented:** Read as '0'
- bit 13      **I2CSIDL:** I2Cx Stop in Idle Mode bit  
 1 = Discontinues module operation when device enters Idle mode  
 0 = Continues module operation in Idle mode
- bit 12      **SCLREL:** SCLx Release Control bit (I<sup>2</sup>C Client mode only)<sup>(1)</sup>  
 1 = Releases the SCLx clock  
 0 = Holds the SCLx clock low (clock stretch)  
If STREN = 1:<sup>(2)</sup>  
 User software may write '0' to initiate a clock stretch and write '1' to release the clock. Hardware clears at the beginning of every Client data byte transmission. Hardware clears at the end of every Client address byte reception. Hardware clears at the end of every Client data byte reception.  
If STREN = 0:  
 User software may only write '1' to release the clock. Hardware clears at the beginning of every Client data byte transmission. Hardware clears at the end of every Client address byte reception.
- bit 11      **STRICT:** I2Cx Strict Reserved Address Rule Enable bit  
 1 = Strict reserved addressing is enforced; for reserved addresses, refer to [Table 17-2](#).  
 (In Client Mode) – The device doesn't respond to reserved address space and addresses falling in that category are NACKed.  
 (In Host Mode) – The device is allowed to generate addresses with reserved address space.  
 0 = Reserved addressing would be Acknowledged.  
 (In Client Mode) – The device will respond to an address falling in the reserved address space. When there is a match with any of the reserved addresses, the device will generate an ACK.  
 (In Host Mode) – Reserved.
- bit 10      **A10M:** 10-Bit Client Address Flag bit  
 1 = I2CxADD is a 10-bit Client address  
 0 = I2CxADD is a 7-bit Client address

- Note 1:** Automatically cleared to '0' at the beginning of Client transmission; automatically cleared to '0' at the end of Client reception.
- 2:** Automatically cleared to '0' at the beginning of Client transmission.
- 3:** The SMB3EN Configuration bit (FDEVOPT[10]) selects between normal and SMBus 3.0 levels.

## REGISTER 17-1: I2CxCONL: I2Cx CONTROL REGISTER LOW (CONTINUED)

- bit 9      **DISSLW:** Slew Rate Control Disable bit  
1 = Slew rate control is disabled for Standard Speed mode (100 kHz, also disabled for 1 MHz mode)  
0 = Slew rate control is enabled for High-Speed mode (400 kHz)
- bit 8      **SMEN:** SMBus Input Levels Enable bit<sup>(3)</sup>  
1 = Enables input logic so thresholds are compliant with the SMBus specification  
0 = Disables SMBus-specific inputs
- bit 7      **GCEN:** General Call Enable bit (I<sup>2</sup>C Client mode only)  
1 = Enables interrupt when a general call address is received in I2CxRSR; module is enabled for reception  
0 = General call address is disabled.
- bit 6      **STREN:** SCLx Clock Stretch Enable bit  
In I<sup>2</sup>C Client mode only; used in conjunction with the SCLREL bit.  
1 = Enables clock stretching  
0 = Disables clock stretching
- bit 5      **ACKDT:** Acknowledge Data bit  
In I<sup>2</sup>C Host mode during Host Receive mode. The value that will be transmitted when the user initiates an Acknowledge sequence at the end of a receive.  
In I<sup>2</sup>C Client mode when AHEN = 1 or DHEN = 1. The value that the Client will transmit when it initiates an Acknowledge sequence at the end of an address or data reception.  
1 = NACK is sent  
0 = ACK is sent
- bit 4      **ACKEN:** Acknowledge Sequence Enable bit  
In I<sup>2</sup>C Host mode only; applicable during Host Receive mode.  
1 = Initiates Acknowledge sequence on SDAx and SCLx pins, and transmits ACKDT data bit  
0 = Acknowledge sequence is Idle
- bit 3      **RCEN:** Receive Enable bit (I<sup>2</sup>C Host mode only)  
1 = Enables Receive mode for I<sup>2</sup>C; automatically cleared by hardware at end of 8-bit receive data byte  
0 = Receive sequence is not in progress
- bit 2      **PEN:** Stop Condition Enable bit (I<sup>2</sup>C Host mode only)  
1 = Initiates Stop condition on SDAx and SCLx pins  
0 = Stop condition is Idle
- bit 1      **RSEN:** Restart Condition Enable bit (I<sup>2</sup>C Host mode only)  
1 = Initiates Restart condition on SDAx and SCLx pins  
0 = Restart condition is Idle
- bit 0      **SEN:** Start Condition Enable bit (I<sup>2</sup>C Host mode only)  
1 = Initiates Start condition on SDAx and SCLx pins  
0 = Start condition is Idle

**Note 1:** Automatically cleared to '0' at the beginning of Client transmission; automatically cleared to '0' at the end of Client reception.

**2:** Automatically cleared to '0' at the beginning of Client transmission.

**3:** The SMB3EN Configuration bit (FDEVOP[10]) selects between normal and SMBus 3.0 levels.

NOTES:

## 18.0 SINGLE-EDGE NIBBLE TRANSMISSION (SENT)

**Note 1:** This data sheet summarizes the features of this group of dsPIC33CK64MC105 family devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “**Single-Edge Nibble Transmission (SENT) Module**” ([www.microchip.com/DS70005145](http://www.microchip.com/DS70005145)) in the “*dsPIC33/PIC24 Family Reference Manual*”.

The Single-Edge Nibble Transmission (SENT) module is based on the SAE J2716, “*SENT – Single-Edge Nibble Transmission for Automotive Applications*”. The SENT protocol is a one-way, single wire, time-modulated serial communication, based on successive falling edges. It is intended for use in applications where high-resolution sensor data need to be communicated from a sensor to an Engine Control Unit (ECU).

The SENTx module has the following major features:

- Selectable Transmit or Receive mode
- Synchronous or Asynchronous Transmit modes
- Automatic Data Rate Synchronization
- Optional Automatic Detection of CRC Errors in Receive mode
- Optional Hardware Calculation of CRC in Transmit mode
- Support for Optional Pause Pulse Period
- Data Buffering for One Message Frame
- Selectable Data Length for Transmit/Receive, Up to Six Nibbles
- Automatic Detection of Framing Errors

SENT protocol timing is based on a predetermined time unit,  $T_{TICK}$ . Both the transmitter and receiver must be preconfigured for  $T_{TICK}$ , which can vary from 3 to 90  $\mu$ s.

A SENT message frame starts with a Sync pulse. The purpose of the Sync pulse is to allow the receiver to calculate the data rate of the message encoded by the transmitter. The SENT specification allows messages to be validated with up to a 20% variation in  $T_{TICK}$ . This allows for the transmitter and receiver to run from different clocks that may be inaccurate, and drift with time and temperature. The data nibbles are 4 bits in length and are encoded as the data value + 12 ticks. This yields a 0 value of 12 ticks and the maximum value, 0xF, of 27 ticks.

A SENT message consists of the following:

- A synchronization/calibration period of 56 tick times
- A status nibble of 12-27 tick times
- Up to six data nibbles of 12-27 tick times
- A CRC nibble of 12-27 tick times
- An optional pause pulse period of 12-768 tick times

Figure 18-1 shows a block diagram of the SENTx module.

Figure 18-2 shows the construction of a typical 6-nibble data frame, with the numbers representing the minimum or maximum number of tick times for each section.

# dsPIC33CK64MC105 FAMILY

FIGURE 18-1: SENTx MODULE BLOCK DIAGRAM

FIGURE 18-2: SENTx PROTOCOL DATA FRAMES

## 18.1 Transmit Mode

By default, the SENTx module is configured for transmit operation. The module can be configured for continuous asynchronous message frame transmission, or alternatively, for Synchronous mode triggered by software. When enabled, the transmitter will send a Sync, followed by the appropriate number of data nibbles, an optional CRC and optional pause pulse. The tick period used by the SENTx transmitter is set by writing a value to the TICKTIME[15:0] (SENTxCON2[15:0]) bits. The tick period calculations are shown in [Equation 18-1](#).

### EQUATION 18-1: TICK PERIOD CALCULATION

$$TICKTIME[15:0] = \frac{TTICK}{TCLK} - 1$$

An optional pause pulse can be used in Asynchronous mode to provide a fixed message frame time period. The frame period used by the SENTx transmitter is set by writing a value to the FRAMETIME[15:0] (SENTxCON3[15:0]) bits. The formulas used to calculate the value of frame time are shown in [Equation 18-2](#).

### EQUATION 18-2: FRAME TIME CALCULATIONS

$$FRAMETIME[15:0] = TTICK/TFRAME$$

$$FRAMETIME[15:0] \geq 122 + 27N$$

$$FRAMETIME[15:0] \geq 848 + 12N$$

Where:

*TFRAME* = Total time of the message from ms

*N* = The number of data nibbles in message, 1-6

**Note:** The module will not produce a pause period with less than 12 ticks, regardless of the FRAMETIME[15:0] value. FRAMETIME[15:0] values beyond 2047 will have no effect on the length of a data frame.

## 18.1.1 TRANSMIT MODE CONFIGURATION

### 18.1.1.1 Initializing the SENTx Module

Perform the following steps to initialize the module:

1. Write RCVEN (SENTxCON1[11]) = 0 for Transmit mode.
2. Write TXM (SENTxCON1[10]) = 0 for Asynchronous Transmit mode or TXM = 1 for Synchronous mode.
3. Write NIBCNT[2:0] (SENTxCON1[2:0]) for the desired data frame length.
4. Write CRCEN (SENTxCON1[8]) for hardware or software CRC calculation.
5. Write PPP (SENTxCON1[7]) for optional pause pulse.
6. If PPP = 1, write TFRAME to SENTxCON3.
7. Write SENTxCON2 with the appropriate value for the desired tick period.
8. Enable interrupts and set interrupt priority.
9. Write initial status and data values to SENTxDATH/L.
10. If CRCEN = 0, calculate CRC and write the value to CRC[3:0] (SENTxDATL[3:0]).
11. Set the SNTEN (SENTxCON1[15]) bit to enable the module.

User software updates to SENTxDATH/L must be performed after the completion of the CRC and before the next message frame's status nibble. The recommended method is to use the message frame completion interrupt to trigger data writes.

# dsPIC33CK64MC105 FAMILY

## 18.2 Receive Mode

The module can be configured for receive operation by setting the RCVEN (SENTxCON1[11]) bit. The time between each falling edge is compared to SYNCMIN[15:0] (SENTxCON3[15:0]) and SYNCMAX[15:0] (SENTxCON2[15:0]), and if the measured time lies between the minimum and maximum limits, the module begins to receive data. The validated Sync time is captured in the SENTxSYNC register and the tick time is calculated. Subsequent falling edges are verified to be within the valid data width and the data are stored in the SENTxDATL/H registers. An interrupt event is generated at the completion of the message and the user software should read the SENTx Data registers before the reception of the next nibble. The equation for SYNCMIN[15:0] and SYNCMAX[15:0] is shown in Equation 18-3.

### EQUATION 18-3: SYNCMIN[15:0] AND SYNCMAX[15:0] CALCULATIONS

$$TTICK = TCLK \cdot (TICKTIME[15:0] + 1)$$

$$FRAMETIME[15:0] = TTICK / TFRAME$$

$$SyncCount = 8 \times FRCV \times TTICK$$

$$SYNCMIN[15:0] = 0.8 \times SyncCount$$

$$SYNCMAX[15:0] = 1.2 \times SyncCount$$

$$FRAMETIME[15:0] \geq 122 + 27N$$

$$FRAMETIME[15:0] \geq 848 + 12N$$

Where:

$TFRAME$  = Total time of the message from ms

$N$  = The number of data nibbles in message, 1-6

$FRCV$  =  $FCY \times$  Prescaler

$TCLK$  =  $FCY /$  Prescaler

For  $T_{TICK} = 3.0 \mu s$  and  $F_{CLK} = 4 \text{ MHz}$ ,  $SYNCMIN[15:0] = 76$ .

**Note:** To ensure a Sync period can be identified, the value written to SYNCMIN[15:0] must be less than the value written to SYNCMAX[15:0].

## 18.2.1 RECEIVE MODE CONFIGURATION

### 18.2.1.1 Initializing the SENTx Module

Perform the following steps to initialize the module:

1. Write RCVEN (SENTxCON1[11]) = 1 for Receive mode.
2. Write NIBCNT[2:0] (SENTxCON1[2:0]) for the desired data frame length.
3. Write CRCEN (SENTxCON1[8]) for hardware or software CRC validation.
4. Write PPP (SENTxCON1[7]) = 1 if pause pulse is present.
5. Write SENTxCON2 with the value of SYNCMAXx (Nominal Sync Period + 20%).
6. Write SENTxCON3 with the value of SYNCMINx (Nominal Sync Period – 20%).
7. Enable interrupts and set interrupt priority.
8. Set the SNTEN (SENTxCON1[15]) bit to enable the module.

The data should be read from the SENTxDATL/H registers after the completion of the CRC and before the next message frame's status nibble. The recommended method is to use the message frame completion interrupt trigger.

## 18.3 SENT Control/Status Registers

**REGISTER 18-1: SENTxCON1: SENTx CONTROL REGISTER 1**

PPP	SPCEN <sup>(2)</sup>	—	PS	—	NIBCNT2	NIBCNT1	NIBCNT0
bit 7							bit 0

**Legend:**

R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared
		x = Bit is unknown

- bit 15      **SNTEN:** SENTx Enable bit  
             1 = SENTx is enabled  
             0 = SENTx is disabled
- bit 14      **Unimplemented:** Read as '0'
- bit 13      **SNTSIDL:** SENTx Stop in Idle Mode bit  
             1 = Discontinues module operation when the device enters Idle mode  
             0 = Continues module operation in Idle mode
- bit 12      **Unimplemented:** Read as '0'
- bit 11      **RCVEN:** SENTx Receive Enable bit  
             1 = SENTx operates as a receiver  
             0 = SENTx operates as a transmitter (sensor)
- bit 10      **TXM:** SENTx Transmit Mode bit<sup>(1)</sup>  
             1 = SENTx transmits data frame only when triggered using the SYNCTXEN status bit  
             0 = SENTx transmits data frames continuously while SNTEN = 1
- bit 9      **TXPOL:** SENTx Transmit Polarity bit<sup>(1)</sup>  
             1 = SENTx data output pin is low in the Idle state  
             0 = SENTx data output pin is high in the Idle state
- bit 8      **CRCEN:** CRC Enable bit  
             Module in Receive Mode (RCVEN = 1):  
             1 = SENTx performs CRC verification on received data using the preferred J2716 method  
             0 = SENTx does not perform CRC verification on received data  
             Module in Transmit Mode (RCVEN = 0):  
             1 = SENTx automatically calculates CRC using the preferred J2716 method  
             0 = SENTx does not calculate CRC
- bit 7      **PPP:** Pause Pulse Present bit  
             1 = SENTx is configured to transmit/receive SENT messages with pause pulse  
             0 = SENTx is configured to transmit/receive SENT messages without pause pulse
- bit 6      **SPCEN:** Short PWM Code Enable bit<sup>(2)</sup>  
             1 = SPC control from external source is enabled  
             0 = SPC control from external source is disabled
- bit 5      **Unimplemented:** Read as '0'

**Note 1:** This bit has no function in Receive mode (RCVEN = 1).  
**Note 2:** This bit has no function in Transmit mode (RCVEN = 0).

bit 15-8      **Unimplemented:** Read as '0'

bit 7      **PAUSE:** Pause Period Status bit

- 1 = The module is transmitting/receiving a pause period
- 0 = The module is not transmitting/receiving a pause period

bit 6-4      **NIB[2:0]:** Nibble Status bits

Module in Transmit Mode (RCVEN = 0):

- 111 = Module is transmitting a CRC nibble
- 110 = Module is transmitting Data Nibble 6
- 101 = Module is transmitting Data Nibble 5
- 100 = Module is transmitting Data Nibble 4
- 011 = Module is transmitting Data Nibble 3
- 010 = Module is transmitting Data Nibble 2
- 001 = Module is transmitting Data Nibble 1
- 000 = Module is transmitting a status nibble or pause period, or is not transmitting

Module in Receive Mode (RCVEN = 1):

- 111 = Module is receiving a CRC nibble or was receiving this nibble when an error occurred
- 110 = Module is receiving Data Nibble 6 or was receiving this nibble when an error occurred
- 101 = Module is receiving Data Nibble 5 or was receiving this nibble when an error occurred
- 100 = Module is receiving Data Nibble 4 or was receiving this nibble when an error occurred
- 011 = Module is receiving Data Nibble 3 or was receiving this nibble when an error occurred
- 010 = Module is receiving Data Nibble 2 or was receiving this nibble when an error occurred
- 001 = Module is receiving Data Nibble 1 or was receiving this nibble when an error occurred
- 000 = Module is receiving a status nibble or waiting for Sync

bit 3      **CRCERR:** CRC Status bit (Receive mode only)

- 1 = A CRC error has occurred for the 1-6 data nibbles in SENTxDATL/H
- 0 = A CRC error has not occurred

bit 2      **FRMERR:** Framing Error Status bit (Receive mode only)

- 1 = A data nibble was received with less than 12 tick periods or greater than 27 tick periods
- 0 = Framing error has not occurred

bit 1      **RXIDLE:** SENTx Receiver Idle Status bit (Receive mode only)

- 1 = The SENTx data bus has been Idle (high) for a period of SYNCMAX[15:0] or greater
- 0 = The SENTx data bus is not Idle

**Note 1:** In Receive mode (RCVEN = 1), the SYNCTXEN bit is read-only.

# dsPIC33CK64MC105 FAMILY

---

## REGISTER 18-2: SENTxSTAT: SENTx STATUS REGISTER (CONTINUED)

bit 0      **SYNCTXEN:** SENTx Synchronization Period Status/Transmit Enable bit<sup>(1)</sup>

Module in Receive Mode (RCVEN = 1):

1 = A valid synchronization period was detected; the module is receiving nibble data

0 = No synchronization period has been detected; the module is not receiving nibble data

Module in Asynchronous Transmit Mode (RCVEN = 0, TXM = 0):

The bit always reads as '1' when the module is enabled, indicating the module transmits SENTx data frames continuously. The bit reads '0' when the module is disabled.

Module in Synchronous Transmit Mode (RCVEN = 0, TXM = 1):

1 = The module is transmitting a SENTx data frame

0 = The module is not transmitting a data frame, user software may set SYNCTXEN to start another data frame transmission

**Note 1:** In Receive mode (RCVEN = 1), the SYNCTXEN bit is read-only.

## 19.0 TIMER1

**Note 1:** This data sheet summarizes the features of the dsPIC33CK64MC105 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “**Timer1 Module**” ([www.microchip.com/DS70005279](http://www.microchip.com/DS70005279)) in the “*dsPIC33/PIC24 Family Reference Manual*”.

The Timer1 module is a 16-bit timer that can operate as a free-running interval timer/counter.

The Timer1 module has the following unique features over other timers:

- Can be Operated in Asynchronous Counter mode
- Asynchronous Timer
- Operational during CPU Sleep mode
- Software Selectable Prescalers 1:1, 1:8, 1:64 and 1:256
- External Clock Selection Control
- The Timer1 External Clock Input (T1CK) can Optionally be Synchronized to the Internal Device Clock and the Clock Synchronization is Performed after the Prescaler

If Timer1 is used for SCCP, the timer should be running in Synchronous mode.

The Timer1 module can operate in one of the following modes:

- Timer mode
- Gated Timer mode
- Synchronous Counter mode
- Asynchronous Counter mode

A block diagram of Timer1 is shown in [Figure 19-1](#).

**FIGURE 19-1: 16-BIT TIMER1 MODULE BLOCK DIAGRAM**

NOTES:

## 20.0 CAPTURE/COMPARE/PWM/TIMER MODULES (SCCP)

**Note 1:** This data sheet summarizes the features of the dsPIC33CK64MC105 family of devices. It is not intended to be a comprehensive reference source. For more information on the SCCP modules, refer to “**Capture/Compare/PWM/Timer (MCCP and SCCP)**” ([www.microchip.com/DS30003035](http://www.microchip.com/DS30003035)) in the “dsPIC33/PIC24 Family Reference Manual”.

dsPIC33CK64MC105 family devices include four SCCP Capture/Compare/PWM/Timer base modules, which provide the functionality of three different peripherals from earlier PIC24F devices. The module can operate in one of three major modes:

- General Purpose Timer
- Input Capture
- Output Compare/PWM

Single Capture/Compare/PWM (SCCP) output modules provide only one PWM output.

The SCCPx modules can be operated in only one of the three major modes at any time. The other modes are not available unless the module is reconfigured for the new mode.

A conceptual block diagram for the module is shown in [Figure 20-1](#). All three modes share a time base generator and a common Timer register pair (CCPxTMRH/L); other shared hardware components are added as a particular mode requires.

Each module has a total of six control and status registers:

- CCPxCON1L ([Register 20-1](#))
- CCPxCON1H ([Register 20-2](#))
- CCPxCON2L ([Register 20-3](#))
- CCPxCON2H ([Register 20-4](#))
- CCPxCON3H ([Register 20-5](#))
- CCPxSTATL ([Register 20-6](#))

Each module also includes eight buffer/counter registers that serve as Timer Value registers or data holding buffers:

- CCPxTMRH/CCPxTMRL (CCPx Timer High/Low Counters)
- CCPxPRH/CCPxPRL (CCPx Timer Period High/Low)
- CCPxRA (CCPx Primary Output Compare Data Buffer)
- CCPxRB (CCPx Secondary Output Compare Data Buffer)
- CCPxBUFH/CCPxBUFL (CCPx Input Capture High/Low Buffers)

**FIGURE 20-1: SCCPx CONCEPTUAL BLOCK DIAGRAM**

# dsPIC33CK64MC105 FAMILY

## 20.1 Time Base Generator

The Timer Clock Generator (TCG) generates a clock for the module's internal time base, using one of the clock signals already available on the microcontroller. This is used as the time reference for the module in its three major modes. The internal time base is shown in Figure 20-2.

There are eight inputs available to the clock generator, which are selected using the CLKSEL[2:0] bits (CCPxCON1L[10:8]). Available sources include the FRC and LPRC, the Secondary Oscillator and the TCLKI External Clock inputs. The system clock is the default source (CLKSEL[2:0] = 000).

**FIGURE 20-2: TIMER CLOCK GENERATOR**

## 20.2 General Purpose Timer

Timer mode is selected when CCSEL = 0 and MOD[3:0] = 0000. The timer can function as a 32-bit timer or a dual 16-bit timer, depending on the setting of the T32 bit (Table 20-1).

**TABLE 20-1: TIMER OPERATION MODE**

T32 (CCPxCON1L[5])	Operating Mode
0	Dual Timer Mode (16-bit)
1	Timer Mode (32-bit)

Dual 16-Bit Timer mode provides a simple timer function with two independent 16-bit timer/counters. The primary timer uses CCPxTMRL and CCPxPRL. Only the primary timer can interact with other modules on the device. It generates the SCCPx sync out signals for use by other SCCP modules. It can also use the SYNC[4:0] bits signal generated by other modules.

The secondary timer uses CCPxTMRH and CCPxPRH. It is intended to be used only as a periodic interrupt source for scheduling CPU events. It does not generate an output sync/trigger signal like the primary time base. In Dual Timer mode, the CCPx Secondary Timer Period register, CCPxPRH, generates the SCCP compare event (CCPxIF) used by many other modules on the device.

The 32-Bit Timer mode uses the CCPxTMRL and CCPxTMRH registers, together, as a single 32-bit timer. When CCPxTMRL overflows, CCPxTMRH increments by one. This mode provides a simple timer function when it is important to track long time periods. Note that the T32 bit (CCPxCON1L[5]) should be set before the CCPxTMRL or CCPxPRH registers are written to initialize the 32-bit timer.

### 20.2.1 SYNC AND TRIGGER OPERATION

In both 16-bit and 32-bit modes, the timer can also function in either synchronization (“sync”) or trigger operation. Both use the SYNC[4:0] bits (CCPxCON1H[4:0]) to determine the input signal source. The difference is how that signal affects the timer.

In sync operation, the timer Reset or clear occurs when the input selected by SYNC[4:0] is asserted. The timer immediately begins to count again from zero unless it is held for some other reason. Sync operation is used whenever the TRIGEN bit (CCPxCON1H[7]) is cleared. SYNC[4:0] can have any value, except ‘11111’.

In trigger operation, the timer is held in Reset until the input selected by SYNC[4:0] is asserted; when it occurs, the timer starts counting. Trigger operation is used whenever the TRIGEN bit is set. In Trigger mode, the timer will continue running after a trigger event as long as the CCPTRIG bit (CCPxSTATL[7]) is set. To clear CCPTRIG, the TRCLR bit (CCPxSTATL[5]) must be set to clear the trigger event, reset the timer and hold it at zero until another trigger event occurs. On dsPIC33CK64MC105 family devices, trigger operation can only be used when the system clock is the time base source (CLKSEL[2:0] = 000).

# dsPIC33CK64MC105 FAMILY

**FIGURE 20-3: DUAL 16-BIT TIMER MODE**

**FIGURE 20-4: 32-BIT TIMER MODE**

# dsPIC33CK64MC105 FAMILY

## 20.3 Output Compare Mode

Output Compare mode compares the Timer register value with the value of one or two Compare registers, depending on its mode of operation. The Output Compare x module, on compare match events, has the ability to generate a single output transition or a train of

output pulses. Like most PIC® MCU peripherals, the Output Compare x module can also generate interrupts on a compare match event.

Table 20-2 shows the various modes available in Output Compare modes.

**TABLE 20-2: OUTPUT COMPARE x/PWMx MODES**

MOD[3:0] (CCPxCON1L[3:0])	T32 (CCPxCON1L[5])	Operating Mode	
0001	0	Output High on Compare (16-bit)	Single Edge Mode
0001	1	Output High on Compare (32-bit)	
0010	0	Output Low on Compare (16-bit)	
0010	1	Output Low on Compare (32-bit)	
0011	0	Output Toggle on Compare (16-bit)	
0011	1	Output Toggle on Compare (32-bit)	
0100	0	Dual Edge Compare (16-bit)	Dual Edge Mode
0101	0	Dual Edge Compare (16-bit buffered)	PWM Mode

**FIGURE 20-5: OUTPUT COMPARE x BLOCK DIAGRAM**

# dsPIC33CK64MC105 FAMILY

## 20.4 Input Capture Mode

Input Capture mode is used to capture a timer value from an independent timer base, upon an event, on an input pin or other internal trigger source. The input capture features are useful in applications requiring frequency (time period) and pulse measurement. Figure 20-6 depicts a simplified block diagram of Input Capture mode.

Input Capture mode uses a dedicated 16/32-bit, synchronous, up counting timer for the capture function. The timer value is written to the FIFO when a capture event occurs. The internal value may be read (with a synchronization delay) using the CCPxTMRH/L register.

To use Input Capture mode, the CCSEL bit (CCPxCON1L[4]) must be set. The T32 and the MOD[3:0] bits are used to select the proper Capture mode, as shown in Table 20-3.

**TABLE 20-3: INPUT CAPTURE x MODES**

MOD[3:0] (CCPxCON1L[3:0])	T32 (CCPxCON1L[5])	Operating Mode
0000	0	Edge Detect (16-bit capture)
0000	1	Edge Detect (32-bit capture)
0001	0	Every Rising (16-bit capture)
0001	1	Every Rising (32-bit capture)
0010	0	Every Falling (16-bit capture)
0010	1	Every Falling (32-bit capture)
0011	0	Every Rising/Falling (16-bit capture)
0011	1	Every Rising/Falling (32-bit capture)
0100	0	Every 4th Rising (16-bit capture)
0100	1	Every 4th Rising (32-bit capture)
0101	0	Every 16th Rising (16-bit capture)
0101	1	Every 16th Rising (32-bit capture)

**FIGURE 20-6: INPUT CAPTURE x BLOCK DIAGRAM**

## 20.5 Auxiliary Output

The SCCPx modules have an auxiliary (secondary) output that provides other peripherals access to internal module signals. The auxiliary output is intended to connect to other SCCP modules, or other digital peripherals, to provide these types of functions:

- Time Base Synchronization
- Peripheral Trigger and Clock Inputs
- Signal Gating

The type of output signal is selected using the AUXOUT[1:0] control bits (CCPxCON2H[4:3]). The type of output signal is also dependent on the module operating mode.

**TABLE 20-4: AUXILIARY OUTPUT**

AUXOUT[1:0]	CCSEL	MOD[3:0]	Comments	Signal Description
00	x	xxxx	Auxiliary Output Disabled	No Output
01	0	0000	Time Base Modes	Time Base Period Reset or Rollover
10				Special Event Trigger Output
11				No Output
01	0	0001 through 1111	Output Compare Modes	Time Base Period Reset or Rollover
10				Output Compare Event Signal
11				Output Compare Signal
01	1	xxxx	Input Capture Modes	Time Base Period Reset or Rollover
10				Reflects the Value of the ICDIS bit

## 21.0 CONFIGURABLE LOGIC CELL (CLC)

**Note 1:** This data sheet summarizes the features of the dsPIC33CK64MC105 family of devices. It is not intended to be a comprehensive reference source. For more information, refer to “Configurable Logic Cell (CLC)” ([www.microchip.com/DS70005298](http://www.microchip.com/DS70005298)) in the “dsPIC33/PIC24 Family Reference Manual”. The information in this data sheet supersedes the information in the FRM.

The Configurable Logic Cell (CLC) module allows the user to specify combinations of signals as inputs to a logic function and to use the logic output to control other peripherals or I/O pins. This provides greater flexibility and potential in embedded designs, since the CLC module can operate outside the limitations of software execution, and supports a vast amount of output designs.

There are four input gates to the selected logic function. These four input gates select from a pool of up to 32 signals that are selected using four data source selection multiplexers. Figure 21-1 shows an overview of the module.

Figure 21-3 shows the details of the data source multiplexers and Figure 21-2 shows the logic input gate connections.

## 21.1 Control Registers

The CLCx module is controlled by the following registers:

- CLCxCONL
- CLCxCONH
- CLCxSEL
- CLCxGLSL
- CLCxGLSH

The CLCx Control registers (CLCxCONL and CLCxCONH) are used to enable the module and interrupts, control the output enable bit, select output polarity and select the logic function. The CLCx Control registers also allow the user to control the logic polarity of not only the cell output, but also some intermediate variables.

The CLCx Input MUX Select register (CLCxSEL) allows the user to select up to four data input sources using the four data input selection multiplexers. Each multiplexer has a list of eight data sources available.

The CLCx Gate Logic Input Select registers (CLCxGLSL and CLCxGLSH) allow the user to select which outputs from each of the selection MUXes are used as inputs to the input gates of the logic cell. Each data source MUX outputs both a true and a negated version of its output. All of these eight signals are enabled, ORed together by the logic cell input gates. If no inputs are selected (CLCxGLS = 0x00), the output will be zero or one, depending on the GxPOL bits.

NOTES:

## 22.0 PERIPHERAL TRIGGER GENERATOR (PTG)

**Note 1:** This data sheet summarizes the features of the dsPIC33CK64MC105 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “**Peripheral Trigger Generator (PTG)**” ([www.microchip.com/DS70000669](http://www.microchip.com/DS70000669)) in the “*dsPIC33/PIC24 Family Reference Manual*”.

The dsPIC33CK64MC105 family Peripheral Trigger Generator (PTG) module is a user-programmable sequencer that is capable of generating complex trigger signal sequences to coordinate the operation of other peripherals. The PTG module is designed to interface with the modules, such as an Analog-to-Digital Converter (ADC), output compare and PWM modules, timers and interrupt controllers.

## 22.1 Features

- Behavior is Step Command Driven:
  - Step commands are eight bits wide
- Commands are Stored in a Step Queue:
  - Queue depth is up to 32 entries
  - Programmable Step execution time (Step delay)
- Supports the Command Sequence Loop:
  - Can be nested one-level deep
  - Conditional or unconditional loop
  - Two 16-bit loop counters
- 15 Hardware Input Triggers:
  - Sensitive to either positive or negative edges, or a high or low level
- One Software Input Trigger
- Generates up to 32 Unique Output Trigger Signals
- Generates Two Types of Trigger Outputs:
  - Individual
  - Broadcast
- Generates up to Ten Unique Interrupt Signals
- Two 16-Bit General Purpose Timers
- Flexible Self-Contained Watchdog Timer (WDT) to Set an Upper Limit to Trigger Wait Time
- Single-Step Command Capability in Debug mode
- Selectable Clock (System, Pulse-Width Modulator (PWM) or ADC)
- Programmable Clock Divider

bit 15-8                      **STEP<sub>2n+1</sub>[7:0]:** PTG Command 4n+1 bits<sup>(2)</sup>  
 A queue location for storage of the STEP<sub>2n+1</sub> command byte, where 'n' is from PTGQUE<sub>n</sub>.

bit                      **STEP<sub>2n</sub>[7:0]:** PTG Command 4n+2 bits<sup>(2)</sup>  
 A queue location for storage of the STEP<sub>2n</sub> command byte, where 'n' are the odd numbered Step Queue Pointers.

**Note 1:** These bits are read-only when the module is executing Step commands.

**2:** Refer to [Table 22-1](#) for the Step command encoding.

# dsPIC33CK64MC105 FAMILY

**TABLE 22-1: PTG STEP COMMAND FORMAT AND DESCRIPTION**

Step Command Byte			
		STEPx[7:0]	
CMD[3:0]		OPTION[3:0]	
bit 7		bit 4 bit 3	bit 0

bit 7-4	Step Command	CMD[3:0]	Command Description
	PTGCTRL	0000	Execute the control command as described by the OPTION[3:0] bits.
	PTGADD	0001	Add contents of the PTGADJ register to the target register as described by the OPTION[3:0] bits.
	PTGCOPY		Copy contents of the PTGHOLD register to the target register as described by the OPTION[3:0] bits.
	PTGSTRB	001x	This command starts an ADC conversion of the channels specified in CMD[0] and OPTION[3:0] bits.
	PTGWHI	0100	Wait for a low-to-high edge input from a selected PTG trigger input as described by the OPTION[3:0] bits.
	PTGWLO	0101	Wait for a high-to-low edge input from a selected PTG trigger input as described by the OPTION[3:0] bits.
	—	0110	Reserved; do not use. <sup>(1)</sup>
	PTGIRQ	0111	Generate individual interrupt request as described by the OPTION[3:0] bits.
	PTGTRIG	100x	Generate individual trigger output as described by the bits, CMD[0]:OPTION[3:0].
	PTGJMP	101x	Copy the values contained in the bits, CMD[0]:OPTION[3:0], to the PTGQPTR register and jump to that Step queue.
	PTGJMPC0	110x	PTGC0 = PTGC0LIM: Increment the PTGQPTR register.
			PTGC0 ≠ PTGC0LIM: Increment Counter 0 (PTGC0) and copy the values contained in the bits, CMD[0]:OPTION[3:0], to the PTGQPTR register, and jump to that Step queue.
	PTGJMPC1	111x	PTGC1 = PTGC1LIM: Increment the PTGQPTR register.
			PTGC1 ≠ PTGC1LIM: Increment Counter 1 (PTGC1) and copy the values contained in the bits, CMD[0]:OPTION[3:0], to the PTGQPTR register, and jump to that Step queue.

**Note 1:** All reserved commands or options will execute, but they do not have any affect (i.e., execute as a NOP instruction).

**TABLE 22-2: PTG COMMAND OPTIONS**

bit 3-0	Step Command	OPTION[3:0]	Command Description
	PTGCTRL <sup>(1)</sup>	0000	NOP.
		0001	Reserved; do not use.
		0010	Disable Step delay timer (PTGSD).
		0011	Reserved; do not use.
		0100	Reserved; do not use.
		0101	Reserved; do not use.
		0110	Enable Step delay timer (PTGSD).
		0111	Reserved; do not use.
		1000	Start and wait for the PTG Timer0 to match the PTGT0LIM register.
		1001	Start and wait for the PTG Timer1 to match the PTGT1LIM register.
		1010	Wait for the software trigger (level, PTGSWT = 1).
		1011	Wait for the software trigger (positive edge, PTGSWT = 0 to 1).
		1100	Copy the PTGC0LIM register contents to the strobe output.
		1101	Copy the PTGC1LIM register contents to the strobe output.
		1110	Reserved; do not use.
		1111	Generate the triggers indicated in the PTGBTE register.
	PTGADD <sup>(1)</sup>	0000	Add the PTGADJ register contents to the PTGC0LIM register.
		0001	Add the PTGADJ register contents to the PTGC1LIM register.
		0010	Add the PTGADJ register contents to the PTGT0LIM register.
		0011	Add the PTGADJ register contents to the PTGT1LIM register.
		0100	Add the PTGADJ register contents to the PTGSDLIM register.
		0101	Add the PTGADJ register contents to the PTGL0 register.
		0110	Reserved; do not use.
		0111	Reserved; do not use.
	PTGCOPY <sup>(1)</sup>	1000	Copy the PTGHOLD register contents to the PTGC0LIM register.
		1001	Copy the PTGHOLD register contents to the PTGC1LIM register.
		1010	Copy the PTGHOLD register contents to the PTGT0LIM register.
		1011	Copy the PTGHOLD register contents to the PTGT1LIM register.
		1100	Copy the PTGHOLD register contents to the PTGSDLIM register.
		1101	Copy the PTGHOLD register contents to the PTGL0 register.
		1110	Reserved; do not use.
		1111	Reserved; do not use.

**Note 1:** All reserved commands or options will execute, but they do not have any affect (i.e., execute as a NOP instruction).

NOTES:

## 23.0 CURRENT BIAS GENERATOR (CBG)

**Note 1:** This data sheet summarizes the features of the dsPIC33CK64MC105 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “**Current Bias Generator (CBG)**” ([www.microchip.com/DS70005253](http://www.microchip.com/DS70005253)) in the “dsPIC33/PIC24 Family Reference Manual”.

**2:** Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The Current Bias Generator (CBG) consists of two classes of current sources: 10  $\mu\text{A}$  and 50  $\mu\text{A}$  sources. The major features of each current source are:

- 10  $\mu\text{A}$  Current Sources:
  - Current sourcing only
  - Up to four independent sources
- 50  $\mu\text{A}$  Current Sources:
  - Selectable current sourcing or sinking
  - Selectable current mirroring for sourcing and sinking

A simplified block diagram of the CBG module is shown in [Figure 23-1](#).

**FIGURE 23-1: CONSTANT-CURRENT SOURCE MODULE BLOCK DIAGRAM<sup>(2)</sup>**

0 = Current source is disabled

bit 0      **SNKEN0**: Sink Enable for Output #0 bit<sup>(1)</sup>

1 = Current sink is enabled

0 = Current sink is disabled

**Note 1:** This bit is only available in 36 and 48-pin package devices.

## 24.0 OPERATIONAL AMPLIFIER

**Note:** The 28-pin device variants support only two op amp instances. Refer to [Table 1](#) and [Table 2](#) for availability.

The dsPIC33CK64MC105 family implements three instances of operational amplifiers (op amps). The op amps can be used for a wide variety of purposes, including signal conditioning and filtering. The three op amps are functionally identical. The block diagram for a single amplifier is shown in [Figure 24-1](#).

The op amps are controlled by two SFR registers: AMPCON1L and AMPCON1H. They remain in a Low-Power state until the AMPON bit is set. Each op amp can then be enabled independently by setting the corresponding AMPENx bit (x = 1, 2, 3).

The NCHDISx bit provides some flexibility regarding input range versus Integral Nonlinearity (INL). When NCHDISx = 0 (default), the op amps have a wider input voltage range (see [Table 31-36](#) in [Section 31.0 “Electrical Characteristics”](#)). When NCHDISx = 1, the wider input range is traded for improved INL performance (lower INL).

NOTES:

## 25.0 DEADMAN TIMER (DMT)

**Note 1:** This data sheet summarizes the features of the dsPIC33CK64MC105 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “**Deadman Timer (DMT)**” ([www.microchip.com/DS70005155](http://www.microchip.com/DS70005155)) in the “*dsPIC33/PIC24 Family Reference Manual*”.

The primary function of the Deadman Timer (DMT) is to interrupt the processor in the event of a software malfunction. The DMT, which works on the system clock, is a free-running instruction fetch timer, which is clocked

whenever an instruction fetch occurs, until a count match occurs. Instructions are not fetched when the processor is in Sleep mode.

DMT can be enabled in the Configuration fuse or by software in the DMTCON register by setting the ON bit. The DMT consists of a 32-bit counter with a time-out count match value, as specified by the two 16-bit Configuration Fuse registers: FDMTCNTL and FDMTCNTH.

A DMT is typically used in mission-critical and safety-critical applications, where any single failure of the software functionality and sequencing must be detected.

Figure 25-1 shows a block diagram of the Deadman Timer module.

## 26.0 32-BIT PROGRAMMABLE CYCLIC REDUNDANCY CHECK (CRC) GENERATOR

**Note 1:** This data sheet summarizes the features of the dsPIC33CK64MC105 family of devices. It is not intended to be a comprehensive reference source. For more information, refer to “32-Bit Programmable Cyclic Redundancy Check (CRC)” ([www.microchip.com/DS30009729](http://www.microchip.com/DS30009729)) in the “dsPIC33/PIC24 Family Reference Manual”.

The 32-bit programmable CRC generator provides a hardware implemented method of quickly generating checksums for various networking and security applications. It offers the following features:

- User-Programmable CRC Polynomial Equation, up to 32 Bits
- Programmable Shift Direction (little or big-endian)
- Independent Data and Polynomial Lengths
- Configurable Interrupt Output
- Data FIFO

A simple version of the CRC shift engine is displayed in [Figure 26-1](#).

**FIGURE 26-1: CRC MODULE BLOCK DIAGRAM**

## 27.0 POWER-SAVING FEATURES

**Note 1:** This data sheet summarizes the features of the dsPIC33CK64MC105 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “**Watchdog Timer and Power-Saving Modes**” ([www.microchip.com/DS70615](http://www.microchip.com/DS70615)) in the “*dsPIC33/PIC24 Family Reference Manual*”.

The dsPIC33CK64MC105 family devices provide the ability to manage power consumption by selectively managing clocking to the CPU and the peripherals. In general, a lower clock frequency and a reduction in the number of peripherals being clocked constitutes lower consumed power.

dsPIC33CK64MC105 family devices can manage power consumption in four ways:

- Clock Frequency
- Instruction-Based Sleep and Idle modes
- Software-Controlled Doze mode
- Selective Peripheral Control in Software

Combinations of these methods can be used to selectively tailor an application’s power consumption while still maintaining critical application features, such as timing-sensitive communications.

### EXAMPLE 27-1: PWRSAV INSTRUCTION SYNTAX

```
PWRSAV #0          ; Put the device into Sleep mode
PWRSAV #1          ; Put the device into Idle mode
```

## 27.1 Clock Frequency and Clock Switching

The dsPIC33CK64MC105 family devices allow a wide range of clock frequencies to be selected under application control. If the system clock configuration is not locked, users can choose low-power or high-precision oscillators by simply changing the NOSC<sub>x</sub> bits (OSCCON[10:8]). The process of changing a system clock during operation, as well as limitations to the process, are discussed in more detail in [Section 9.0 “Oscillator with High-Frequency PLL”](#).

## 27.2 Instruction-Based Power-Saving Modes

The dsPIC33CK64MC105 family devices have two special power-saving modes that are entered through the execution of a special PWRSAV instruction. Sleep mode stops clock operation and halts all code execution. Idle mode halts the CPU and code execution, but allows peripheral modules to continue operation. The assembler syntax of the PWRSAV instruction is shown in [Example 27-1](#).

Sleep and Idle modes can be exited as a result of an enabled interrupt, WDT time-out or a device Reset. When the device exits these modes, it is said to “wake-up”.

# dsPIC33CK64MC105 FAMILY

## 27.2.1 SLEEP MODE

The following occurs in Sleep mode:

- The system clock source is shut down. If an on-chip oscillator is used, it is turned off.
- The device current consumption is reduced to a minimum, provided that no I/O pin is sourcing current.
- The Fail-Safe Clock Monitor does not operate, since the system clock source is disabled.
- The LPRC clock continues to run in Sleep mode if the WDT is enabled.
- The WDT, if enabled, is automatically cleared prior to entering Sleep mode.
- Some device features or peripherals can continue to operate. This includes items such as the Input Change Notification on the I/O ports or peripherals that use an External Clock input.
- Any peripheral that requires the system clock source for its operation is disabled.

The device wakes up from Sleep mode on any of the these events:

- Any interrupt source that is individually enabled
- Any form of device Reset
- A WDT time-out

On wake-up from Sleep mode, the processor restarts with the same clock source that was active when Sleep mode was entered.

For optimal power savings, the regulators can be configured to go into standby when Sleep mode is entered by clearing the VREGS (RCON[8]) bit (default configuration).

If the application requires a faster wake-up time, and can accept higher current requirements, the VREGS (RCON[8]) bit can be set to keep the regulators active during Sleep mode. The available Low-Power Sleep modes are shown in [Table 27-1](#). Additional regulator information is available in [Section 28.4 “On-Chip Voltage Regulator”](#).

**TABLE 27-1: LOW-POWER SLEEP MODES**

Relative Power	LPWREN	VREGS	MODE
Highest	0	1	Full power, active
—	0	0	Full power, standby
—	1 <sup>(1)</sup>	1	Low power, active
Lowest	1 <sup>(1)</sup>	0	Low power, standby

**Note 1:** Low-Power modes; when LPWREN = 1, can only be used in the industrial temperature range.

## 27.2.2 IDLE MODE

The following occurs in Idle mode:

- The CPU stops executing instructions.
- The WDT is automatically cleared.
- The system clock source remains active. By default, all peripheral modules continue to operate normally from the system clock source, but can also be selectively disabled (see [Section 27.4 “Peripheral Module Disable”](#)).
- If the WDT or FSCM is enabled, the LPRC also remains active.

The device wakes from Idle mode on any of these events:

- Any interrupt that is individually enabled
- Any device Reset
- A WDT time-out

On wake-up from Idle mode, the clock is reapplied to the CPU and instruction execution will begin (2-4 clock cycles later), starting with the instruction following the PWRSAV instruction or the first instruction in the ISR.

All peripherals also have the option to discontinue operation when Idle mode is entered to allow for increased power savings. This option is selectable in the control register of each peripheral; for example, the SIDL bit in the Timer1 Control register (T1CON[13]).

## 27.2.3 INTERRUPTS COINCIDENT WITH POWER SAVE INSTRUCTIONS

Any interrupt that coincides with the execution of a PWRSAV instruction is held off until entry into Sleep or Idle mode has completed. The device then wakes up from Sleep or Idle mode.

## 27.3 Doze Mode

The preferred strategies for reducing power consumption are changing clock speed and invoking one of the power-saving modes. In some circumstances, this cannot be practical. For example, it may be necessary for an application to maintain uninterrupted synchronous communication, even while it is doing nothing else. Reducing system clock speed can introduce communication errors, while using a power-saving mode can stop communications completely.

Doze mode is a simple and effective alternative method to reduce power consumption while the device is still executing code. In this mode, the system clock continues to operate from the same source and at the same speed. Peripheral modules continue to be clocked at the same speed, while the CPU clock speed is reduced. Synchronization between the two clock domains is maintained, allowing the peripherals to access the SFRs while the CPU executes code at a slower rate.

Doze mode is enabled by setting the DOZEN bit (CLKDIV[11]). The ratio between peripheral and core clock speed is determined by the DOZE[2:0] bits (CLKDIV[14:12]). There are eight possible configurations, from 1:1 to 1:128, with 1:1 being the default setting.

Programs can use Doze mode to selectively reduce power consumption in event-driven applications. This allows clock-sensitive functions, such as synchronous communications, to continue without interruption while the CPU idles, waiting for something to invoke an interrupt routine. An automatic return to full-speed CPU operation on interrupts can be enabled by setting the ROI bit (CLKDIV[15]). By default, interrupt events have no effect on Doze mode operation.

## 27.4 Peripheral Module Disable

The Peripheral Module Disable (PMD) registers provide a method to disable a peripheral module by stopping all clock sources supplied to that module. When a peripheral is disabled using the appropriate PMD control bit, the peripheral is in a Minimum Power Consumption state. The control and status registers associated with the peripheral are also disabled, so writes to those registers do not have any effect and read values are invalid.

A peripheral module is enabled only if both the associated bit in the PMD register is cleared and the peripheral is supported by the specific dsPIC® DSC variant. If the peripheral is present in the device, it is enabled in the PMD register by default.

**Note 1:** If a PMD bit is set, the corresponding module is disabled after a delay of one instruction cycle. Similarly, if a PMD bit is cleared, the corresponding module is enabled after a delay of one instruction cycle (assuming the module control registers are already configured to enable module operation).

## 27.5 Power-Saving Resources

Many useful resources are provided on the main product page of the Microchip website for the devices listed in this data sheet. This product page contains the latest updates and additional information.

### 27.5.1 KEY RESOURCES

NOTES:

# dsPIC33CK64MC105 FAMILY

## 28.0 SPECIAL FEATURES

**Note:** This data sheet summarizes the features of the dsPIC33CK64MC105 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the related section of the “*dsPIC33/PIC24 Family Reference Manual*”, which is available from the Microchip website ([www.microchip.com](http://www.microchip.com)).

The dsPIC33CK64MC105 family devices include several features intended to maximize application flexibility and reliability, and minimize cost through elimination of external components. These are:

- Flexible Configuration
- Watchdog Timer (WDT)
- Code Protection and CodeGuard™ Security
- JTAG Boundary Scan Interface
- In-Circuit Serial Programming™ (ICSP™)
- In-Circuit Emulation
- Brown-out Reset (BOR)

## 28.1 Configuration Bits

In dsPIC33CK64MC105 family devices, the Configuration Words are implemented as volatile memory. This means that configuration data will get loaded to volatile memory (from the Flash Configuration Words) each time the device is powered up. Configuration data are stored at the end of the on-chip program memory space, known as the Flash Configuration Words. Their specific locations are shown in [Table 28-1](#). The configuration data are automatically loaded from the Flash Configuration Words to the proper Configuration Shadow registers during device Resets.

**Note:** Configuration data are reloaded on all types of device Resets.

When creating applications for these devices, users should always specifically allocate the location of the Flash Configuration Words for configuration data in their code for the compiler. This is to make certain that program code is not stored in this address when the code is compiled. Program code executing out of configuration space will cause a device Reset.

**Note:** Performing a page erase operation on the last page of program memory clears the Flash Configuration Words.

## 28.2 Device Identification

The dsPIC33CK64MC105 devices have two Identification registers, near the end of configuration memory space, that store the Device ID (DEVID) and Device Revision (DEVREV). These registers are used to

determine the mask, variant and manufacturing information about the device. These registers are read-only and are shown in [Register 28-16](#) and [Register 28-17](#).

### REGISTER 28-16: DEVREV: DEVICE REVISION REGISTER

## 28.3 User OTP Memory

The dsPIC33CK64MC105 family devices contain 64 One-Time-Programmable (OTP) double words, located at addresses, 801700h through 8017FEh. Each 48-bit OTP double word can only be written one time. The OTP Words can be used for storing checksums, code revisions, manufacturing dates, manufacturing lot numbers or any other application-specific information.

The OTP area is not cleared by any erase command. This memory can be written only once.

## 28.4 On-Chip Voltage Regulator

The dsPIC33CK64MC105 family devices have a capacitorless internal voltage regulator to supply power to the core at 1.2V (typical). The voltage regulator, VREG, provides power for the core. The PLL is powered using a separate regulator, VREG3, as shown in Figure 28-1. The regulators have Low-Power and Standby modes for use in Sleep modes. For additional information about Sleep, see Section 27.2.1 “Sleep Mode”.

When the regulators are in Low-Power mode (LPWREN = 1), the power available to the core is limited.

Before the LPWREN bit is set, the device should be placed into a Lower Power state by disabling peripherals and lowering CPU frequency (e.g., 8 MHz FRC without PLL). The output voltages of the two regulators can be controlled independently by the user, which gives the capability to save additional power during Sleep mode.

---

## 28.5 Brown-out Reset (BOR)

The Brown-out Reset (BOR) module is based on an internal voltage reference circuit that monitors the regulated supply voltage. The main purpose of the BOR module is to generate a device Reset when a brown-out condition occurs. Brown-out conditions are generally caused by glitches on the AC mains (for example, missing portions of the AC cycle waveform due to bad power transmission lines or voltage sags due to excessive current draw when a large inductive load is turned on).

A BOR generates a Reset pulse which resets the device. The BOR selects the clock source based on the device Configuration bit selections.

If an oscillator mode is selected, the BOR activates the Oscillator Start-up Timer (OST). The system clock is held until OST expires. If the PLL is used, the clock is held until the LOCK bit (OSCCON[5]) is '1'.

The BOR status bit (RCON[1]) is set to indicate that a BOR has occurred. The BOR circuit continues to operate while in Sleep or Idle mode and resets the device should VDD fall below the BOR threshold voltage.

# dsPIC33CK64MC105 FAMILY

## 28.6 Dual Watchdog Timer (WDT)

**Note 1:** This data sheet summarizes the features of the dsPIC33CK64MC105 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “Dual Watchdog Timer”, ([www.microchip.com/DS70005250](http://www.microchip.com/DS70005250)) in the “dsPIC33/PIC24 Family Reference Manual”.

The dsPIC33 dual Watchdog Timer (WDT) is described in this section. Refer to Figure 28-2 for a block diagram of the WDT.

The WDT, when enabled, operates from the internal Low-Power RC (LPRC) Oscillator clock source or a selectable clock source in Run mode. The WDT can be used to detect system software malfunctions by resetting the device if the WDT is not cleared periodically in software. The WDT can be configured in Windowed

mode or Non-Windowed mode. Various WDT time-out periods can be selected using the WDT postscaler. The WDT can also be used to wake the device from Sleep or Idle mode (Power Save mode). If the WDT expires and issues a device Reset, the WTDO bit in RCON (Register 6-1) will be set.

The following are some of the key features of the WDT modules:

- Configuration or Software Controlled
- Separate User-Configurable Time-out Periods for Run and Sleep/Idle
- Can Wake the Device from Sleep or Idle
- User-Selectable Clock Source in Run mode
- Operates from LPRC in Sleep/Idle mode

**Note:** The WDT is not automatically reset when a Fail-Safe Clock Monitor event occurs. The user should issue a CLRWDT instruction after a clock fail event is detected.

---

## 28.7 JTAG Interface

The dsPIC33CK64MC105 family devices implement a JTAG interface, which supports boundary scan device testing. Programming is not supported through the JTAG interface; only boundary scan is supported.

**Note:** Refer to “Programming and Diagnostics” ([www.microchip.com/DS70608](http://www.microchip.com/DS70608)) in the “dsPIC33/PIC24 Family Reference Manual” for further information on usage, configuration and operation of the JTAG interface.

## 28.8 In-Circuit Serial Programming™ (ICSP™)

The dsPIC33CK64MC105 family devices can be serially programmed while in the end application circuit. This is done with two lines for clock and data, and three other lines for power, ground and the programming sequence. Serial programming allows customers to manufacture boards with unprogrammed devices and then program the device just before shipping the product. Serial programming also allows the most recent firmware or a custom firmware to be programmed.

Any of the three pairs of programming clock/data pins can be used:

- PGC1 and PGD1
- PGC2 and PGD2
- PGC3 and PGD3

## 28.9 In-Circuit Debugger

When the MPLAB® tool is selected as a debugger, the in-circuit debugging functionality is enabled. This function allows simple debugging functions when used with MPLAB IDE. Debugging functionality is controlled through the PGCx (Emulation/Debug Clock) and PGDx (Emulation/Debug Data) pin functions.

Any of the three pairs of debugging clock/data pins can be used:

- PGC1 and PGD1
- PGC2 and PGD2
- PGC3 and PGD3

To use the in-circuit debugger function of the device, the design must implement ICSP connections to  $\overline{MCLR}$ ,  $V_{DD}$ ,  $V_{SS}$  and the PGCx/PGDx pin pair. In addition, when the feature is enabled, some of the resources are not available for general use. These resources include the first 80 bytes of data RAM and two I/O pins (PGCx and PGDx).

## 28.10 Code Protection and CodeGuard™ Security

dsPIC33CK64MC105 family devices offer multiple levels of security for protecting individual intellectual property. The program Flash protection can be broken up into three segments: Boot Segment (BS), General Segment (GS) and Configuration Segment (CS). Boot Segment has the highest security privilege and can be thought to have limited restrictions when accessing other segments. General Segment has the least security and is intended for the end user system code. Configuration Segment contains only the device user configuration data, which is located at the end of the program memory space.

The code protection features are controlled by the Configuration registers, FSEC and FBSLIM. The FSEC register controls the code-protect level for each segment and if that segment is write-protected. The size of BS and GS will depend on the BSLIM[12:0] bits setting and if the Alternate Interrupt Vector Table (AIVT) is enabled. The BSLIM[12:0] bits define the number of pages for BS with each page containing 1024 IW. The smallest BS size is one page, which will consist of the Interrupt Vector Table (IVT) and 512 IW of code protection.

If the AIVT is enabled, the last page of BS will contain the AIVT and will not contain any BS code. With AIVT enabled, the smallest BS size is now two pages (2048 IW), with one page for the IVT and BS code, and the other page for the AIVT. Write protection of the BS does not cover the AIVT. The last page of BS can always be programmed or erased by BS code. The General Segment will start at the next page and will consume the rest of program Flash, except for the Flash Configuration Words. The IVT will assume GS security only if BS is not enabled. The IVT is protected from being programmed or page erased when either security segment has enabled write protection.

The different device security segments are shown in Figure 28-3. Here, all three segments are shown, but are not required. If only basic code protection is required, then GS can be enabled independently or combined with CS, if desired.

**FIGURE 28-3: SECURITY SEGMENTS EXAMPLE**

NOTES:

## 29.0 INSTRUCTION SET SUMMARY

**Note:** This data sheet summarizes the features of the dsPIC33CK64MC105 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the “16-Bit MCU and DSC Programmer’s Reference Manual” ([www.microchip.com/DS70000157](http://www.microchip.com/DS70000157)), which is available from the Microchip website ([www.microchip.com](http://www.microchip.com)).

The dsPIC33CK64MC105 family instruction set is almost identical to that of the dsPIC30F and dsPIC33F.

Most instructions are a single program memory word (24 bits). Only three instructions require two program memory locations.

Each single-word instruction is a 24-bit word, divided into an 8-bit opcode, which specifies the instruction type and one or more operands, which further specify the operation of the instruction.

The instruction set is highly orthogonal and is grouped into five basic categories:

- Word or byte-oriented operations
- Bit-oriented operations
- Literal operations
- DSP operations
- Control operations

Table 29-1 lists the general symbols used in describing the instructions.

The dsPIC33 instruction set summary in Table 29-2 lists all the instructions, along with the status flags affected by each instruction.

Most word or byte-oriented W register instructions (including barrel shift instructions) have three operands:

- The first source operand, which is typically a register ‘Wb’ without any address modifier
- The second source operand, which is typically a register ‘Ws’ with or without an address modifier
- The destination of the result, which is typically a register ‘Wd’ with or without an address modifier

However, word or byte-oriented file register instructions have two operands:

- The file register specified by the value ‘f’
- The destination, which could be either the file register ‘f’ or the W0 register, which is denoted as ‘WREG’

Most bit-oriented instructions (including simple rotate/shift instructions) have two operands:

- The W register (with or without an address modifier) or file register (specified by the value of ‘Ws’ or ‘f’)
- The bit in the W register or file register (specified by a literal value or indirectly by the contents of register ‘Wb’)

The literal instructions that involve data movement can use some of the following operands:

- A literal value to be loaded into a W register or file register (specified by ‘k’)
- The W register or file register where the literal value is to be loaded (specified by ‘Wb’ or ‘f’)

However, literal instructions that involve arithmetic or logical operations use some of the following operands:

- The first source operand, which is a register ‘Wb’ without any address modifier
- The second source operand, which is a literal value
- The destination of the result (only if not the same as the first source operand), which is typically a register ‘Wd’ with or without an address modifier

The MAC class of DSP instructions can use some of the following operands:

- The accumulator (A or B) to be used (required operand)
- The W registers to be used as the two operands
- The X and Y address space prefetch operations
- The X and Y address space prefetch destinations
- The accumulator write-back destination

The other DSP instructions do not involve any multiplication and can include:

- The accumulator to be used (required)
- The source or destination operand (designated as Wso or Wdo, respectively) with or without an address modifier
- The amount of shift specified by a W register ‘Wn’ or a literal value

The control instructions can use some of the following operands:

- A program memory address
- The mode of the Table Read and Table Write instructions

# dsPIC33CK64MC105 FAMILY

Most instructions are a single word. Certain double-word instructions are designed to provide all the required information in these 48 bits. In the second word, the 8 MSBs are '0's. If this second word is executed as an instruction (by itself), it executes as a NOP.

The double-word instructions execute in two instruction cycles.

Most single-word instructions are executed in a single instruction cycle, unless a conditional test is true or the Program Counter is changed as a result of the instruction, or a PSV or Table Read is performed. In these cases, the execution takes multiple instruction cycles, with the additional instruction cycle(s) executed as a NOP. Certain instructions that involve skipping over the subsequent instruction require either two or three

cycles if the skip is performed, depending on whether the instruction being skipped is a single-word or two-word instruction. Moreover, double-word moves require two cycles.

**Note:** In dsPIC33CK64MC105 devices, read and Read-Modify-Write operations on non-CPU Special Function Registers require an additional cycle when compared to dsPIC30F, dsPIC33F, PIC24F and PIC24H devices.

**Note:** For more details on the instruction set, refer to the "16-Bit MCU and DSC Programmer's Reference Manual" ([www.microchip.com/DS7000157](http://www.microchip.com/DS7000157)).

**TABLE 29-1: SYMBOLS USED IN OPCODE DESCRIPTIONS**

Field	Description
#text	Means literal defined by "text"
(text)	Means "content of text"
[text]	Means "the location addressed by text"
{ }	Optional field or operation
a ∈ {b, c, d}	a is selected from the set of values b, c, d
[n:m]	Register bit field
.b	Byte mode selection
.d	Double-Word mode selection
.S	Shadow register select
.w	Word mode selection (default)
Acc	One of two accumulators {A, B}
AWB	Accumulator Write-Back Destination Address register ∈ {W13, [W13]+ = 2}
bit4	4-bit bit selection field (used in word-addressed instructions) ∈ {0...15}
C, DC, N, OV, Z	MCU Status bits: Carry, Digit Carry, Negative, Overflow, Sticky Zero
Expr	Absolute address, label or expression (resolved by the linker)
f	File register address ∈ {0x0000...0x1FFF}
lit1	1-bit unsigned literal ∈ {0,1}
lit4	4-bit unsigned literal ∈ {0...15}
lit5	5-bit unsigned literal ∈ {0...31}
lit8	8-bit unsigned literal ∈ {0...255}
lit10	10-bit unsigned literal ∈ {0...255} for Byte mode, {0:1023} for Word mode
lit14	14-bit unsigned literal ∈ {0...16384}
lit16	16-bit unsigned literal ∈ {0...65535}
lit23	23-bit unsigned literal ∈ {0...8388608}; LSb must be '0'
None	Field does not require an entry, can be blank
OA, OB, SA, SB	DSP Status bits: ACCA Overflow, ACCB Overflow, ACCA Saturate, ACCB Saturate
PC	Program Counter
Slit10	10-bit signed literal ∈ {-512...511}
Slit16	16-bit signed literal ∈ {-32768...32767}
Slit6	6-bit signed literal ∈ {-16...16}
Wb	Base W register ∈ {W0...W15}
Wd	Destination W register ∈ { Wd, [Wd], [Wd++], [Wd--], [++Wd], [--Wd] }
Wdo	Destination W register ∈ { Wnd, [Wnd], [Wnd++], [Wnd--], [++Wnd], [--Wnd], [Wnd+Wb] }
Wm,Wn	Dividend, Divisor Working register pair (direct addressing)

# dsPIC33CK64MC105 FAMILY

**TABLE 29-1: SYMBOLS USED IN OPCODE DESCRIPTIONS (CONTINUED)**

Field	Description
Wm*Wm	Multiplicand and Multiplier Working register pair for Square instructions $\in$ {W4 * W4, W5 * W5, W6 * W6, W7 * W7}
Wm*Wn	Multiplicand and Multiplier Working register pair for DSP instructions $\in$ {W4 * W5, W4 * W6, W4 * W7, W5 * W6, W5 * W7, W6 * W7}
Wn	One of 16 Working registers $\in$ {W0...W15}
Wnd	One of 16 Destination Working registers $\in$ {W0...W15}
Wns	One of 16 Source Working registers $\in$ {W0...W15}
WREG	W0 (Working register used in file register instructions)
Ws	Source W register $\in$ { Ws, [Ws], [Ws++], [Ws--], [++Ws], [--Ws] }

105	ZE	ZE Ws, Wnd	Wnd = Zero-Extend Ws	1	1	C,Z,N

**Note 1:** Read and Read-Modify-Write (e.g., bit operations and logical operations) on non-CPU SFRs incur an additional instruction cycle.

**2:** The divide instructions must be preceded with a "REPEAT #5" instruction, such that they are executed six consecutive times.

## 30.0 DEVELOPMENT SUPPORT

Move a design from concept to production in record time with Microchip's award-winning development tools. Microchip tools work together to provide state of the art debugging for any project with easy-to-use Graphical User Interfaces (GUIs) in our free MPLAB<sup>®</sup> X and Atmel Studio Integrated Development Environments (IDEs), and our code generation tools. Providing the ultimate ease-of-use experience, Microchip's line of programmers, debuggers and emulators work seamlessly with our software tools. Microchip development boards help evaluate the best silicon device for an application, while our line of third party tools round out our comprehensive development tool solutions.

Microchip's MPLAB X and Atmel Studio ecosystems provide a variety of embedded design tools to consider, which support multiple devices, such as PIC<sup>®</sup> MCUs, AVR<sup>®</sup> MCUs, SAM MCUs and dsPIC<sup>®</sup> DSCs. MPLAB X tools are compatible with Windows<sup>®</sup>, Linux<sup>®</sup> and Mac<sup>®</sup> operating systems while Atmel Studio tools are compatible with Windows.

NOTES:

# dsPIC33CK64MC105 FAMILY

## 31.0 ELECTRICAL CHARACTERISTICS

This section provides an overview of the dsPIC33CK64MC105 family electrical characteristics. Additional information will be provided in future revisions of this document as it becomes available.

Absolute maximum ratings for the dsPIC33CK64MC105 family are listed below. Exposure to these maximum rating conditions for extended periods may affect device reliability. Functional operation of the device at these, or any other conditions above the parameters indicated in the operation listings of this specification, is not implied.

### Absolute Maximum Ratings<sup>(1)</sup>

Ambient temperature under bias .....	-40°C to +125°C
Storage temperature .....	-65°C to +150°C
Voltage on VDD with respect to VSS .....	-0.3V to +4.0V
Voltage on any pin that is not 5V tolerant with respect to VSS <sup>(3)</sup> .....	-0.3V to (VDD + 0.3V)
Voltage on any 5V tolerant pin with respect to VSS <sup>(3)</sup> .....	-0.3V to +5.5V
Maximum current out of VSS pins .....	300 mA
Maximum current into VDD pins <sup>(2)</sup> .....	300 mA
Maximum current sunk/sourced by any regular I/O pin.....	15 mA
Maximum current sunk/sourced by an I/O pin with increased current drive strength (RB1, RC8, RC9 and RD8) .....	25 mA
Maximum current sunk by a group of I/Os between two VSS pins <sup>(4)</sup> .....	75 mA
Maximum current sourced by a group of I/Os between two VDD pins <sup>(4)</sup> .....	75 mA
Maximum current sunk by all I/Os <sup>(2,5)</sup> .....	200 mA
Maximum current sourced by all I/Os <sup>(2,5)</sup> .....	200 mA

**Note 1:** Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those, or any other conditions above those indicated in the operation listings of this specification, is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

**2:** Maximum allowable current is a function of device maximum power dissipation (see [Table 31-2](#)).

**3:** See the “[Pin Diagrams](#)” section for the 5V tolerant pins.

**4:** Not applicable to AVDD and AVSS pins.

**5:** For 28-pin packages, the maximum current sunk/sourced by all I/Os is limited by 150 mA.

## 31.1 DC Characteristics

**TABLE 31-1: dsPIC33CK64MC105 FAMILY OPERATING CONDITIONS**

VDD Range	Temperature Range	Maximum CPU Clock Frequency
3.0V to 3.6V	-40°C to +125°C	100 MIPS

**TABLE 31-2: THERMAL OPERATING CONDITIONS**

Rating	Symbol	Min.	Max.	Unit
Industrial Temperature Devices				
Operating Junction Temperature Range	TJ	-40	+125	°C
Operating Ambient Temperature Range	TA	-40	+85	°C
Extended Temperature Devices				
Operating Junction Temperature Range	TJ	-40	+140	°C
Operating Ambient Temperature Range	TA	-40	+125	°C
Power Dissipation: Internal Chip Power Dissipation: $P_{INT} = V_{DD} \times (I_{DD} - \sum I_{OH})$ I/O Pin Power Dissipation: $I/O = \sum (\{V_{DD} - V_{OH}\} \times I_{OH}) + \sum (V_{OL} \times I_{OL})$	PD	PINT + PI/O		W
Maximum Allowed Power Dissipation	PDMAX	$(T_J - T_A)/\theta_{JA}$		W

**TABLE 31-3: PACKAGE THERMAL RESISTANCE<sup>(1)</sup>**

Package	Symbol	Typ.	Unit
48-Pin TQFP 7x7 mm	$\theta_{JA}$	62.76	°C/W
48-Pin UQFN 6x6 mm	$\theta_{JA}$	27.6	°C/W
36-Pin UQFN 5x5 mm	$\theta_{JA}$	29.2	°C/W
28-Pin UQFN 6x6 mm	$\theta_{JA}$	22.41	°C/W
28-Pin UQFN 4x4 mm	$\theta_{JA}$	26.0	°C/W
28-Pin SSOP 5.30 mm	$\theta_{JA}$	52.84	°C/W

**Note 1:** Junction to ambient thermal resistance, Theta-JA ( $\theta_{JA}$ ) numbers are achieved by package simulations.

**TABLE 31-4: OPERATING VOLTAGE SPECIFICATIONS**

Operating Conditions (unless otherwise stated): -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended						
Param No.	Symbol	Characteristic	Min.	Max.	Units	Conditions
DC10	VDD	<b>Supply Voltage</b>	3.0	3.6	V	
DC16	VPOR	<b>VDD Start Voltage</b> to Ensure Internal Power-on Reset Signal	—	VSS	V	
DC17	SVDD	<b>VDD Rise Rate</b> to Ensure Internal Power-on Reset Signal	0.03	—	V/ms	0V-3V in 100 ms
BO10	VBOR <sup>(1)</sup>	<b>BOR Event</b> on VDD Transition High-to-Low	2.68	2.99	V	

**Note 1:** Device is functional at  $V_{BORMIN} < V_{DD} < V_{DDMIN}$ . Analog modules (ADC and comparators) may have degraded performance. The VBOR parameter is for design guidance only and is not tested in manufacturing.

**TABLE 31-5: OPERATING CURRENT (IDD)<sup>(2)</sup>**

Parameter No.	Typ. <sup>(1)</sup>	Max.	Units	Conditions		
DC20	5.5	6.6	mA	-40°C	3.3V	10 MIPS (N = 1, N2 = 5, N3 = 2, M = 50, FVCO = 400 MHz, FPLLO = 40 MHz)
	5.2	6.4	mA	+25°C		
	5.7	11.9	mA	+85°C		
	7.2	16	mA	+125°C		
DC21	7.1	8.4	mA	-40°C	3.3V	20 MIPS (N = 1, N2 = 5, N3 = 1, M = 60, FVCO = 480 MHz, FPLLO = 280 MHz)
	7.1	8.1	mA	+25°C		
	7.5	13.4	mA	+85°C		
	8.8	17.5	mA	+125°C		
DC22	10.6	12.6	mA	-40°C	3.3V	40 MIPS (N = 1, N2 = 3, N3 = 1, M = 60, FVCO = 480 MHz, FPLLO = 160 MHz)
	10.3	12.3	mA	+25°C		
	11.6	17.1	mA	+85°C		
	12.3	21.3	mA	+125°C		
DC23	15.4	18	mA	-40°C	3.3V	70 MIPS (N = 1, N2 = 2, N3 = 1, M = 70, FVCO = 560 MHz, FPLLO = 280 MHz)
	15.2	17.4	mA	+25°C		
	16	22	mA	+85°C		
	17.5	26.3	mA	+125°C		
DC24	19	22.5	mA	-40°C	3.3V	90 MIPS (N = 1, N2 = 2, N3 = 1, M = 90, FVCO = 720 MHz, FPLLO = 360 MHz)
	18.9	21.6	mA	+25°C		
	19.7	26	mA	+85°C		
	21.2	29.6	mA	+125°C		
DC25	20.7	22.4	mA	-40°C	3.3V	100 MIPS (N = 1, N2 = 1, N3 = 1, M = 50, FVCO = 400 MHz, FPLLO = 400 MHz)
	20.7	21.5	mA	+25°C		
	21.4	25.4	mA	+85°C		
	23	29.5	mA	+125°C		

**Note 1:** Data in the "Typ." column are for design guidance only and are not tested.

**2:** Base run current (IDD) is measured as follows:

- Oscillator is switched to EC+PLL mode in software
- OSC1 pin is driven with external 8 MHz square wave with levels from 0.3V to VDD – 0.3V
- OSC2 pin is configured as an I/O in the Configuration Words (OSCIOFNC (FOSC[2]) = 0)
- FSCM is disabled (FCKSM[1:0] (FOSC[7:6]) = 01)
- Watchdog Timer is disabled (FWDTEN (FWDT[15]) = 0)
- All I/O pins (except OSC1) are configured as outputs and driving low
- No peripheral modules are operating or being clocked (defined PMDx bits are all '1's)
- JTAG is disabled (JTAGEN (FICD[5]) = 0)
- NOP instructions are executed

# dsPIC33CK64MC105 FAMILY

**TABLE 31-6: IDLE CURRENT (I<sub>IDLE</sub>)<sup>(2)</sup>**

Parameter No.	Typ. <sup>(1)</sup>	Max.	Units	Conditions		
DC30	4.5	5.4	mA	-40°C	3.3V	10 MIPS (N = 1, N2 = 5, N3 = 2, M = 50, Fvco = 400 MHz, FPLLO = 40 MHz)
	4.1	5.2	mA	+25°C		
	4.7	9.1	mA	+85°C		
	6.0	14.2	mA	+125°C		
DC31	4.8	5.9	mA	-40°C	3.3V	20 MIPS (N = 1, N2 = 5, N3 = 1, M = 50, Fvco = 400 MHz, FPLLO = 80 MHz)
	4.7	5.7	mA	+25°C		
	5.0	9.6	mA	+85°C		
	6.6	14.8	mA	+125°C		
DC32	6.2	7.3	mA	-40°C	3.3V	40 MIPS (N = 1, N2 = 3, N3 = 1, M = 60, Fvco = 480 MHz, FPLLO = 160 MHz)
	5.8	7.1	mA	+25°C		
	6.5	11	mA	+85°C		
	8.0	16.1	mA	+125°C		
DC33	7.8	9.3	mA	-40°C	3.3V	70 MIPS (N = 1, N2 = 2, N3 = 1, M = 70, Fvco = 560 MHz, FPLLO = 280 MHz)
	7.6	9.0	mA	+25°C		
	8.1	12.8	mA	+85°C		
	9.8	18	mA	+125°C		
DC34	9.3	11.4	mA	-40°C	3.3V	90 MIPS (N = 1, N2 = 2, N3 = 1, M = 90, Fvco = 720 MHz, FPLLO = 360 MHz)
	9.2	11.2	mA	+25°C		
	10.0	14.5	mA	+85°C		
	11.6	19.8	mA	+125°C		
DC35	10.0	12	mA	-40°C	3.3V	100 MIPS (N = 1, N2 = 1, N3 = 1, M = 50, Fvco = 400 MHz, FPLLO = 400 MHz)
	10.0	12	mA	+25°C		
	10.7	13.4	mA	+85°C		
	12.5	18.6	mA	+125°C		

**Note 1:** Data in the “Typ.” column are for design guidance only and are not tested.

**2:** Base Idle current (I<sub>IDLE</sub>) is measured as follows:

- Oscillator is switched to EC+PLL mode in software
- OSC1 pin is driven with external 8 MHz square wave with levels from 0.3V to V<sub>DD</sub> – 0.3V
- OSC2 is configured as an I/O in the Configuration Words (OSCIOFNC (FOSC[2]) = 0)
- FSCM is disabled (FCKSM[1:0] (FOSC[7:6]) = 01)
- Watchdog Timer is disabled (FWDTEN (FWDT[15]) = 0)
- All I/O pins (except OSC1) are configured as outputs and driving low
- No peripheral modules are operating or being clocked (defined PMDx bits are all ‘1’s)
- JTAG is disabled (JTAGEN (FICD[5]) = 0)
- NOP instructions are executed

# dsPIC33CK64MC105 FAMILY

**TABLE 31-7: POWER-DOWN CURRENT (IPD)<sup>(2)</sup>**

Parameter No.	Typ. <sup>(1)</sup>	Max.	Units	Conditions		
DC40 <sup>(3,4)</sup>	0.15	0.48	mA	-40°C	3.3V	VREGS bit (RCON[8]) = 0 LPWREN bit (VREGCON[15]) = 1
	0.23	1.1	mA	+25°C		
	0.86	4.2	mA	+85°C		
DC41	0.9	—	mA	-40°C	3.3V	VREGS bit (RCON[8]) = 1 LPWREN bit (VREGCON[15]) = 0
	0.9	—	mA	+25°C		
	1.5	—	mA	+85°C		
	2.9	11	mA	+125°C		

**Note 1:** Data in the “Typ.” column are for design guidance only and are not tested.

**2:** Base Sleep current (IPD) is measured with:

- OSC1 pin is driven with external 8 MHz square wave with levels from 0.3V to VDD – 0.3V
- OSC2 is configured as an I/O in the Configuration Words (OSCIOFNC (FOSC[2]) = 0)
- FSCM is disabled (FCKSM[1:0] (FOSC[7:6]) = 01)
- Watchdog Timer is disabled (FWDTEN (FWDT[15]) = 0)
- All I/O pins (except OSC1) are configured as outputs and driving low
- No peripheral modules are operating or being clocked (defined PMDx bits are all ‘1’s)
- JTAG is disabled (JTAGEN (FICD[5]) = 0)

**3:** The Regulator Standby mode, when the VREGS bit = 0, is operational only in industrial temperature range: -40°C ≤ TA ≤ +85°C.

**4:** The Regulator Low-Power mode, when LPWREN = 1, is operational only in industrial temperature range: -40°C ≤ TA ≤ +85°C.

**TABLE 31-8: DOZE CURRENT (IDOZE)**

Parameter No.	Typ. <sup>(1)</sup>	Doze Ratio	Units	Conditions		
DC70	12.1	1:2	mA	-40°C	3.3V	70 MIPS (N = 1, N2 = 2, N3 = 1, M = 70, FVCO = 560 MHz, FPLLO = 280 MHz)
	8.0	1:128	mA			
	12.0	1:2	mA	+25°C		
	7.8	1:128	mA			
	12.4	1:2	mA	+85°C		
	8.3	1:128	mA			
	13.8	1:2	mA	+125°C		
8.8	1:128	mA				
DC71	15.8	1:2	mA	-40°C	3.3V	100 MIPS (N = 1, N2 = 1, N3 = 1, M = 50, FVCO = 400 MHz, FPLLO = 400 MHz)
	10.4	1:128	mA			
	15.7	1:2	mA	+25°C		
	10.3	1:128	mA			
	16.6	1:2	mA	+85°C		
	11.2	1:128	mA			
	18.1	1:2	mA	+125°C		
12.7	1:128	mA				

**Note 1:** Data in the “Typ.” column are for design guidance only and are not tested.

# dsPIC33CK64MC105 FAMILY

**TABLE 31-9: WATCHDOG TIMER DELTA CURRENT ( $\Delta I_{WDT}$ )<sup>(1)</sup>**

Parameter No.	Typ.	Units	Conditions	
DC61	1	$\mu\text{A}$	-40°C	3.3V
	2	$\mu\text{A}$	+25°C	
	4	$\mu\text{A}$	+85°C	
	11	$\mu\text{A}$	+125°C	

**Note 1:** The  $\Delta I_{WDT}$  current is the additional current consumed when the module is enabled. This current should be added to the base IPD current. All parameters are for design guidance only and are not tested.

**TABLE 31-10: PWM DELTA CURRENT<sup>(1)</sup>**

Parameter No.	Typ.	Max.	Units	Conditions	
DC100	5.59	6.8	mA	-40°C	3.3V PWM Output Frequency = 500 kHz, PWM Input (FPLLO = 500 MHz), (VCO = 1000 MHz, PLLFBD = 125)
	5.87	6.9	mA	+25°C	
	5.99	7.4	mA	+85°C	
	6.05	7.4	mA	+125°C	
DC101	4.52	6.2	mA	-40°C	3.3V PWM Output Frequency = 500 kHz, PWM Input (FPLLO = 400 MHz), (VCO = 400 MHz, PLLFBD = 100)
	4.68	6.5	mA	+25°C	
	4.77	6.5	mA	+85°C	
	4.81	6.7	mA	+125°C	
DC102	2.39	3.96	mA	-40°C	3.3V PWM Output Frequency = 500 kHz, PWM Input (FPLLO = 200 MHz), (VCO = 200 MHz, PLLFBD = 50)
	2.42	3.44	mA	+25°C	
	2.47	3.4	mA	+85°C	
	2.49	4.2	mA	+125°C	
DC103	1.24	2	mA	-40°C	3.3V PWM Output Frequency = 500 kHz, PWM Input (FPLLO = 100 MHz), (VCO = 100 MHz, PLLFBD = 25)
	1.26	2.1	mA	+25°C	
	1.28	2.2	mA	+85°C	
	1.31	2.2	mA	+125°C	

**Note 1:** PLL current is not included. The PLL current will be the same if more than one PWM is running. All parameters are characterized but not tested during manufacturing.

**TABLE 31-11: ADC DELTA CURRENT<sup>(1)</sup>**

Parameter No.	Typ.	Max.	Units	Conditions	
DC120	5.35	5.9	mA	-40°C	3.3V TAD = 14.3 ns (3.5 Msps conversion rate)
	5.42	5.9	mA	+25°C	
	5.44	5.7	mA	+85°C	
	5.46	5.7	mA	+125°C	

**Note 1:** Shared core continuous conversion. TAD = 14.3 nS (3.5 Msps conversion rate). Listed delta currents are for only one ADC core. All parameters are characterized but not tested during manufacturing.

# dsPIC33CK64MC105 FAMILY

**TABLE 31-12: COMPARATOR + DAC DELTA CURRENT**

Parameter No.	Typ.	Max.	Units	Conditions		
DC130	1.38	—	mA	-40°C	3.3V	FPLLO @ 500 MHz <sup>(1)</sup>
	1.28	—	mA	+25°C		
	1.30	—	mA	+85°C		
	1.37	—	mA	+125°C		

**Note 1:** Listed delta currents are for only one comparator + DAC instance. All parameters are characterized but not tested during manufacturing.

**TABLE 31-13: OP AMP DELTA CURRENT<sup>(1)</sup>**

Parameter No.	Typ.	Max.	Units	Conditions		
DC140	0.21	0.42	mA	-40°C	3.3V	
	0.22	0.44	mA	+25°C		
	0.23	0.52	mA	+85°C		
	0.47	0.89	mA	+125°C		

**Note 1:** Listed delta currents are for only one op amp instance. All parameters are characterized but not tested during manufacturing.

**Note 1:** Parameters are for design guidance only and are not tested in manufacturing.

**2:** The module is functional at VBORMIN < VDD < VDDMIN, but with degraded performance. The module functionality is tested, but not characterized.

**3:** Parameters are characterized but not tested in manufacturing.

**4:** The op amps use CMOS input circuitry with negligible input bias current. The maximum “effective bias current” is the I/O pin leakage specified by electrical Parameter [DI50](#).

# dsPIC33CK64MC105 FAMILY

## 32.0 HIGH-TEMPERATURE ELECTRICAL CHARACTERISTICS

This section provides an overview of the dsPIC33CK64MC105 family devices operating in an ambient temperature range of -40°C to +150°C.

The specifications between -40°C to +150°C are identical to those shown in [Section 31.0 “Electrical Characteristics”](#) for operation between -40°C to +125°C, with the exception of the parameters listed in this section.

Parameters in this section begin with an H, which denotes High temperature. For example, Parameter [DC20](#) in [Section 31.0 “Electrical Characteristics”](#) is the Industrial and Extended temperature equivalent of [HDC20](#).

Absolute maximum ratings for the dsPIC33CK64MC105 family high-temperature devices are listed below. Exposure to these maximum rating conditions for extended periods can affect device reliability. Functional operation of the device, at these or any other conditions above the parameters indicated in the operation listings of this specification, is not implied.

### Absolute Maximum Ratings<sup>(1)</sup>

Ambient temperature under bias .....	-40°C to +150°C
Storage temperature .....	-65°C to +150°C
Voltage on VDD with respect to VSS .....	-0.3V to +4.0V
Voltage on any pin that is not 5V tolerant with respect to VSS <sup>(3)</sup> .....	-0.3V to (VDD + 0.3V)
Voltage on any 5V tolerant pin with respect to VSS when VDD ≥ 3.0V <sup>(3)</sup> .....	-0.3V to +5.5V
Voltage on any 5V tolerant pin with respect to VSS when VDD < 3.0V <sup>(3)</sup> .....	-0.3V to +3.6V
Maximum current out of VSS pin .....	300 mA
Maximum current into VDD pin <sup>(2)</sup> .....	300 mA
Maximum current sunk/sourced by any regular I/O pin .....	15 mA
Maximum current sunk/sourced by an I/O pin with increased current drive strength (RB1, RC8, RC9 and RD8) .....	25 mA
Maximum current sunk by a group of I/Os between two VSS pins <sup>(4)</sup> .....	75 mA
Maximum current sourced by a group of I/Os between two VDD pins <sup>(4)</sup> .....	75 mA
Maximum current sunk by all I/Os <sup>(2,5)</sup> .....	200 mA
Maximum current sourced by all I/Os <sup>(2,5)</sup> .....	200 mA

**Note 1:** Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those, or any other conditions above those indicated in the operation listings of this specification, is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

- 2:** Maximum allowable current is a function of device maximum power dissipation (see [Table 32-2](#)).
- 3:** See the “[Pin Diagrams](#)” section for the 5V tolerant pins.
- 4:** Not applicable to AVDD and AVSS pins.
- 5:** For 28-pin packages, the maximum current sunk/sourced by all I/Os is limited by 150 mA.

## 32.1 DC Characteristics

**TABLE 32-1: OPERATING MIPS vs. VOLTAGE**

VDD Range	Temperature Range	Maximum CPU Clock Frequency
3.0V to 3.6V	-40°C to +150°C	70

**TABLE 32-2: THERMAL OPERATING CONDITIONS**

Rating	Symbol	Min.	Max.	Unit
High-Temperature Devices				
Operating Junction Temperature Range	TJ	-40	+165	°C
Operating Ambient Temperature Range	TA	-40	+150	°C
Power Dissipation: Internal Chip Power Dissipation: PINT = VDD x (IDD – Σ IOH) I/O Pin Power Dissipation: I/O = Σ ({VDD – VOH} x IOH) + Σ (VOL x IOL)	PD	PINT + PI/O		W
Maximum Allowed Power Dissipation	PDMAX	(TJ – TA)/θJA		W

**TABLE 32-3: THERMAL PACKAGING CHARACTERISTICS<sup>(1)</sup>**

Package	Symbol	Typ.	Unit
28-Pin UQFN 4x4 mm	θJA	26.0	°C/W
48-Pin TQFP 7x7 mm	θJA	62.76	°C/W
48-Pin UQFN 6x6 mm	θJA	27.6	°C/W
36-Pin UQFN 5x5 mm	θJA	29.2	°C/W
28-Pin UQFN 6x6 mm	θJA	22.41	°C/W
28-Pin SSOP 5.30 mm	θJA	52.84	°C/W

**Note 1:** Junction to ambient thermal resistance, Theta-JA (θJA) numbers are achieved by package simulations.

**TABLE 32-4: OPERATING VOLTAGE SPECIFICATIONS**

Operating Conditions (unless otherwise stated): -40°C ≤ TA ≤ +150°C for High						
Param No.	Symbol	Characteristic	Min.	Max.	Units	Conditions
HDC10	VDD	<b>Supply Voltage</b>	3.0	3.6	V	
HDC16	VPOR	<b>VDD Start Voltage</b> to Ensure Internal Power-on Reset Signal	—	VSS	V	
HDC17	SVDD	<b>VDD Rise Rate</b> to Ensure Internal Power-on Reset Signal	0.03	—	V/ms	0V-3V in 100 ms
HBO10	VBOR <sup>(1)</sup>	<b>BOR Event on VDD Transition High-to-Low</b>	2.68	2.99	V	

**Note 1:** Device is functional at VBORMIN < VDD < VDDMIN. Analog modules (ADC and comparators) may have degraded performance. The VBOR parameter is for design guidance only and is not tested in manufacturing.

# dsPIC33CK64MC105 FAMILY

**TABLE 32-5: OPERATING CURRENT (I<sub>DD</sub>)<sup>(2)</sup>**

Parameter No.	Typ. <sup>(1)</sup>	Max.	Units	Conditions		
HDC20	10.2	24.1	mA	+150°C	3.3V	10 MIPS (N1 = 1, N2 = 5, N3 = 2, M = 50, F <sub>VCO</sub> = 400 MHz, F <sub>PLLO</sub> = 40 MHz)
HDC21	12.2	25.4	mA	+150°C	3.3V	20 MIPS (N1 = 1, N2 = 5, N3 = 1, M = 50, F <sub>VCO</sub> = 400 MHz, F <sub>PLLO</sub> = 80 MHz)
HDC22	15.5	29.0	mA	+150°C	3.3V	40 MIPS (N1 = 1, N2 = 3, N3 = 1, M = 60, F <sub>VCO</sub> = 480 MHz, F <sub>PLLO</sub> = 160 MHz)
HDC23	21.2	34.1	mA	+150°C	3.3V	70 MIPS (N1 = 1, N2 = 2, N3 = 1, M = 70, F <sub>VCO</sub> = 560 MHz, F <sub>PLLO</sub> = 280 MHz)

**Note 1:** Data in the “Typ.” column are for design guidance only and are not tested.

**2:** Base Run current (I<sub>DD</sub>) is measured as follows:

- Oscillator is switched to EC+PLL mode in software
- OSC1 pin is driven with external 8 MHz square wave with levels from 0.3V to V<sub>DD</sub> – 0.3V
- OSC2 is configured as an I/O in the Configuration Words (OSCIOFCN (FOSC[2]) = 0)
- FSCM is disabled (FCKSM[1:0] (FOSC[7:6]) = 01)
- Watchdog Timer is disabled (FWDT[15] = 0 and WDTCONL[15] = 0)
- All I/O pins (except OSC1) are configured as outputs and driving low
- No peripheral modules are operating or being clocked (defined PMDx bits are all ‘1’s)
- JTAG is disabled (JTAGEN (FICD[5]) = 0)
- NOP instructions are executed in `while(1)` loop

HDC41	9.7	22.6	mA	+150°C	3.3V	20 MIPS (N1 = 1, N2 = 5, N3 = 1, M = 50, FVCO = 400 MHz, FPLLO = 80 MHz)
HDC42	11.2	24	mA	+150°C	3.3V	40 MIPS (N1 = 1, N2 = 3, N3 = 1, M = 60, FVCO = 480 MHz, FPLLO = 160 MHz)
HDC43	13.4	25.8	mA	+150°C	3.3V	70 MIPS (N1 = 1, N2 = 2, N3 = 1, M = 70, FVCO = 560 MHz, FPLLO = 280 MHz)

**Note 1:** Data in the “Typ.” column are for design guidance only and are not tested.

**2:** Base Idle current (I<sub>IDLE</sub>) is measured as follows:

- Oscillator is switched to EC+PLL mode in software
- OSC1 pin is driven with external 8 MHz square wave with levels from 0.3V to V<sub>DD</sub> – 0.3V
- OSC2 is configured as an I/O in the Configuration Words (OSCIOFCN (FOSC[2]) = 0)
- FSCM is disabled (FCKSM[1:0] (FOSC[7:6]) = 01)
- Watchdog Timer is disabled (FWDT[15] = 0 and WDTCONL[15] = 0)
- All I/O pins (except OSC1) are configured as outputs and driving low
- No peripheral modules are operating or being clocked (defined PMDx bits are all ‘1’s)
- JTAG is disabled (JTAGEN (FICD[5]) = 0)
- Flash in standby with NVMSIDL (NVMCON[12]) = 1

# dsPIC33CK64MC105 FAMILY

**TABLE 32-7: POWER-DOWN CURRENT (IPD)<sup>(2)</sup>**

Parameter No.	Characteristic	Typ. <sup>(1)</sup>	Max.	Units	Conditions	
HDC60	Base Power-Down Current	6.3	19.8	mA	+150°C	3.3V

**Note 1:** Data in the “Typ.” column are for design guidance only and are not tested.

**2:** Base Sleep current (IPD) is measured as follows:

- OSC1 pin is driven with external 8 MHz square wave with levels from 0.3V to VDD – 0.3V
- OSC2 is configured as an I/O in the Configuration Words (OSCIOFCN (FOSC[2]) = 0)
- FSCM is disabled (FCKSM[1:0] (FOSC[7:6]) = 01)
- Watchdog Timer is disabled (FWDT[15] = 0 and WDTCONL[15] = 0)
- All I/O pins (except OSC1) are configured as outputs and driving low
- No peripheral modules are operating or being clocked (defined PMDx bits are all ‘1’s)
- JTAG is disabled (JTAGEN (FICD[5]) = 0)
- The regulators are in Active mode, VREGS bit = 1 (Standby mode only valid up to +85°C)
- The regulators are in Full-Power mode, LPWREN bit = 0 (Low-Power mode only valid up to +85°C)

**TABLE 32-8: DOZE CURRENT (IDOZE)**

Parameter No.	Typ. <sup>(1)</sup>	Max.	Doze Ratio	Units	Conditions		
HDC70	17.9	30.1	1:2	mA	+150°C	3.3V	70 MIPS (N = 1, N2 = 2, N3 = 1, M = 70, FVCO = 560 MHz, FPLLO = 280 MHz)
	13.6	26	1:128	mA			

**Note 1:** Data in the “Typ.” column are for design guidance only and are not tested.

**TABLE 32-9: WATCHDOG TIMER DELTA CURRENT ( $\Delta I_{WDT}$ )<sup>(1)</sup>**

Parameter No.	Typ.	Max.	Units	Conditions	
HDC61	24	—	μA	+150°C	3.3V

**Note 1:** The  $\Delta I_{WDT}$  current is the additional current consumed when the module is enabled. This current should be added to the base IPD current. All parameters are characterized but not tested during manufacturing.

## APPENDIX A: REVISION HISTORY

### Revision A (June 2019)

This is the initial version of the document.

### Revision B (October 2019)

This revision incorporates the following updates:

- Sections:
  - Changes the document title from **“16-Bit Digital Signal Controllers with High-Speed ADC, Op Amps, Comparators and High-Resolution PWM”** to **“16-Bit Digital Signal Controllers with High-Speed ADC, Op Amps, Comparators and High-Speed PWM”**.
  - Changes Chapter 11 title from **“High-Resolution PWM to High-Speed PWM”**.
  - Updates **11.0 “High-Speed PWM”**, **“High-Speed Analog-to-Digital Converter”**, **“Microcontroller Features”**, **“Peripheral Features”**, **“Pin Diagrams”**, **Section 10.4 “Registers”**, **Section 11.0 “High-Speed PWM”**, **Section 12.2 “Temperature Sensor”**, **Section 18.0 “Single-Edge Nibble Transmission (SENT)”** and **Section 32.0 “Packaging Information”**.
- Registers:
  - Register 7-5, Register 9-6, Register 11-1, Register 11-5, Register 11-6, Register 11-10, Register 11-19, Register 11-24, Register 11-26, Register 11-32, Register 12-6, Register 12-8, Register 12-15, Register 12-16, Register 12-23, Register 12-26, Register 13-1, Register 13-9, Register 15-2, Register 18-1, Register 20-4, Register 21-3, Register 23-1, Register 23-2, Register 23-3, Register 26-3, Register 26-4 and Register 28-6.
  - Adds Register 20-7.
- Tables:
  - Updates Table 1, Table 5-1, Table 8-4, Table 22-3, Table 22-4, Table 31-5, Table 31-6, Table 31-7, Table 31-8, Table 31-10, Table 31-11, Table 31-12 and Table 31-13.
- Figures:
  - Updates Figure 12-1, Figure 12-2 and Figure 23-1.

### Revision C (August 2020)

This revision incorporates the following updates:

- Sections:
  - **“Operating Conditions”**, **“Safety Features”**, **“Pin Diagrams”**, **“Microcontroller Features”**, **“Peripheral Features”**, **“Safety Features”**, **“Referenced Sources”**, **Section 2.5 “External Oscillator Pins”**, **Section 2.6 “External Oscillator Layout Guidance”**, **Section 5.5 “Flash OTP by ICSP™ Write Inhibit”**, **Section 5.5.1 “Activating Flash OTP by ICSP Write Inhibit”**, **Section 8.2 “Configuring Analog and Digital Port Pins”**, **Section 9.7 “Reference Clock Output”**, **Section 10.0 “Direct Memory Access (DMA) Controller”**, **Section 11.0 “High-Resolution PWM”**, **Section 14.0 “Quadrature Encoder Interface (QEI)”**, **Section 16.0 “Serial Peripheral Interface (SPI)”**, **Section 28.5 “Brown-out Reset (BOR)”**, **Section 28.6 “Dual Watchdog Timer (WDT)”**, **Section 28.7 “JTAG Interface”** and **“Product Identification System”**.
  - Adds **Section 32.0 “High-Temperature Electrical Characteristics”**.
- Registers:
  - Register 3-3, Register 7-2, Register 7-3, Register 7-7, Register 8-9, Register 8-10, Register 8-11, Register 8-12, Register 9-3, Register 9-8, Register 12-6, Register 12-20, Register 12-21, Register 13-1, Register 13-9, Register 15-4, Register 18-1, Register 21-3, Register 23-2, Register 23-3, Register 24-2, Register 28-6 and Register 28-19.
- Tables:
  - Table 1, Table 2, Table 3, Table 4, Table 5, Table 1-1, Table 4-6, Table 4-13, Table 7-1, Table 7-2, Table 7-3, Table 7-4, Table 7-5, Table 8-1, Table 8-2, Table 8-4, Table 8-5, Table 8-6, Table 8-7, Table 28-1, Table 28-2, Table 31-5, Table 31-6, Table 31-7, Table 31-10, Table 31-11, Table 31-12, Table 31-13, Table 31-15, Table 31-21, Table 31-23, Table 31-30, Table 31-31, Table 31-32, Table 31-33, Table 31-36 and Table 32-9.
  - Adds Table 32-16.
- Figures:
  - Figure 1-1, Figure 2-4, Figure 2-5, Figure 2-6, Figure 4-1, Figure 12-1, Figure 16-5, Figure 19-1, Figure 23-1 and Figure 28-2.

Other minor typographical corrections throughout the document.

# dsPIC33CK64MC105 FAMILY

---

## Revision D (July 2021)

This revision incorporates the following updates:

- Change in title from “**High-Speed PWM**” to “**High-Resolution PWM**”; changed throughout document.
- Sections:
  - “**Microcontroller Features**”, 28-Pin UQFN and 36-Pin UQFN in “**Pin Diagrams**”, **Section 4.3 “BIST Overview”**, **Section 4.3.1 “BIST at Start-up”**, **Section 5.4 “Error Correcting Code (ECC)”**, **Section 8.5.4 “Input Mapping”**, **Section 9.2 “CPU Clocking”**, **Section 12.0 “High-Speed, 12-Bit Analog-to-Digital Converter (ADC)”**, **Section 16.0 “Serial Peripheral Interface (SPI)”**, **Section 20.1 “Time Base Generator”**, **Section 27.2.1 “Sleep Mode”**, **Section 27.2.2 “Idle Mode”** and **Section 28.6 “Dual Watchdog Timer (WDT)”**.
  - Adds **Section 9.5 “Low-Power RC (LPRC) Oscillator”** and **Section 12.4 “Differential-Mode”**.
- Registers:
  - [Register 5-1](#), [Register 7-5](#), [Register 9-1](#), [Register 9-6](#), [Register 21-3](#), [Register 28-4](#), [Register 28-6](#), [Register 28-18](#) and [Register 28-19](#).
- Tables:
  - [Table 4-10](#), [Table 4-11](#), [Table 9-1](#), [Table 12-1](#), [Table 22-3](#), [Table 31-12](#), [Table 31-23](#), [Table 31-24](#), [Table 31-33](#), [Table 31-36](#), [Table 32-7](#) and [Table 32-17](#).
  - Adds [Table 32-16](#).
  - Removes [Table 32-17: ADC Module Accuracy](#).
- Figures:
  - [Figure 9-1](#), [Figure 9-2](#), [Figure 9-5](#), [Figure 28-1](#) and [Figure 28-2](#).
- Adds new terminology cross references table ([Table 6](#)) that provides updated terminology for depreciated naming conventions.

NOTES:

## THE MICROCHIP WEBSITE

Microchip provides online support via our WWW site at [www.microchip.com](http://www.microchip.com). This website is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the website contains the following information:

- **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- **General Technical Support** – Frequently Asked Questions (FAQ), technical support requests, online discussion groups, Microchip consultant program member listing
- **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

## CUSTOMER CHANGE NOTIFICATION SERVICE

Microchip's customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip website at [www.microchip.com](http://www.microchip.com). Under "Support", click on "Customer Change Notification" and follow the registration instructions.

## CUSTOMER SUPPORT

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- Local Sales Office
- Field Application Engineer (FAE)
- Technical Support

Customers should contact their distributor, representative or Field Application Engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

**Technical support is available through the website at: <http://microchip.com/support>**

## PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

dsPIC 33 CK 64 MC 105 T - I / PT - XXX	
Microchip Trademark	_____
Architecture	_____
Flash Memory Family	_____
Program Memory Size (Kbyte)	_____
Product Group	_____
Pin Count	_____
Tape and Reel Flag (if applicable)	_____
Temperature Range	_____
Package	_____
Pattern	_____

<b>Architecture:</b>	33 = 16-Bit Digital Signal Controller
<b>Product Group:</b>	MC = Motor Control
<b>Pin Count:</b>	02 = 28-pin 03 = 36-pin 05 = 48-pin
<b>Temperature Range:</b>	I = -40°C to +85°C (Industrial) E = -40°C to +125°C (Extended) H = -40°C to +150°C (High)
<b>Package:</b>	SS = Plastic Shrink Small Outline – (28-pin) 5.30 mm body (SSOP) M6 = Ultra Thin Plastic Quad Flat, No Lead – (28-pin) 4x4 mm body (UQFN) 2N = Ultra Thin Plastic Quad Flat, No Lead – (28-pin) 6x6 mm body (UQFN) M5 = Ultra Thin Plastic Quad Flat, No Lead – (36-pin) 5x5 mm body (UQFN) PT = Thin Quad Flatpack – (48-pin) 7x7 mm body (TQFP) M4 = Ultra Thin Plastic Quad Flat, No Lead – (48-pin) 6x6 mm body (UQFN)

**Examples:**  
dsPIC33CK64MC105-I/PT:  
dsPIC33, 64-Kbyte Program Memory,  
Motor Control, 48-Pin,  
Industrial Temperature,  
TQFP Package.

NOTES:

---

**Note the following details of the code protection feature on Microchip devices:**

- Microchip products meet the specifications contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is secure when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods being used in attempts to breach the code protection features of the Microchip devices. We believe that these methods require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Attempts to breach these code protection features, most likely, cannot be accomplished without violating Microchip's intellectual property rights.
- Microchip is willing to work with any customer who is concerned about the integrity of its code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of its code. Code protection does not mean that we are guaranteeing the product is "unbreakable." Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication is provided for the sole purpose of designing with and using Microchip products. Information regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications.

THIS INFORMATION IS PROVIDED BY MICROCHIP "AS IS". MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION INCLUDING BUT NOT LIMITED TO ANY IMPLIED WARRANTIES OF NON-INFRINGEMENT, MERCHANTABILITY, AND FITNESS FOR A PARTICULAR PURPOSE OR WARRANTIES RELATED TO ITS CONDITION, QUALITY, OR PERFORMANCE.

IN NO EVENT WILL MICROCHIP BE LIABLE FOR ANY INDIRECT, SPECIAL, PUNITIVE, INCIDENTAL OR CONSEQUENTIAL LOSS, DAMAGE, COST OR EXPENSE OF ANY KIND WHATSOEVER RELATED TO THE INFORMATION OR ITS USE, HOWEVER CAUSED, EVEN IF MICROCHIP HAS BEEN ADVISED OF THE POSSIBILITY OR THE DAMAGES ARE FORESEEABLE. TO THE FULLEST EXTENT ALLOWED BY LAW, MICROCHIP'S TOTAL LIABILITY ON ALL CLAIMS IN ANY WAY RELATED TO THE INFORMATION OR ITS USE WILL NOT EXCEED THE AMOUNT OF FEES, IF ANY, THAT YOU HAVE PAID DIRECTLY TO MICROCHIP FOR THE INFORMATION. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.

**Trademarks**

The Microchip name and logo, the Microchip logo, Adaptec, AnyRate, AVR, AVR logo, AVR Freaks, BesTime, BitCloud, chipKIT, chipKIT logo, CryptoMemory, CryptoRF, dsPIC, FlashFlex, flexPWR, HELDO, IGL00, JukeBlox, KeeLoq, Kleer, LANCheck, LinkMD, maXStylus, maXTouch, MediaLB, megaAVR, Microsemi, Microsemi logo, MOST, MOST logo, MPLAB, OptoLyzr, PackeTime, PIC, picoPower, PICSTART, PIC32 logo, PolarFire, Prochip Designer, QTouch, SAM-BA, SenGenuity, SpyNIC, SST, SST Logo, SuperFlash, Symmetricom, SyncServer, Tachyon, TimeSource, tinyAVR, UNI/O, Vectron, and XMEGA are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

AgileSwitch, APT, ClockWorks, The Embedded Control Solutions Company, EtherSynch, FlashTec, Hyper Speed Control, HyperLight Load, IntelliMOS, Libero, motorBench, mTouch, Powermite 3, Precision Edge, ProASIC, ProASIC Plus, ProASIC Plus logo, Quiet-Wire, SmartFusion, SyncWorld, Temux, TimeCesium, TimeHub, TimePictra, TimeProvider, WinPath, and ZL are registered trademarks of Microchip Technology Incorporated in the U.S.A.

Adjacent Key Suppression, AKS, Analog-for-the-Digital Age, Any Capacitor, AnyIn, AnyOut, Augmented Switching, BlueSky, BodyCom, CodeGuard, CryptoAuthentication, CryptoAutomotive, CryptoCompanion, CryptoController, dsPICDEM, dsPICDEM.net, Dynamic Average Matching, DAM, ECAN, Espresso T1S, EtherGREEN, IdealBridge, In-Circuit Serial Programming, ICSP, INICnet, Intelligent Paralleling, Inter-Chip Connectivity, JitterBlocker, maxCrypto, maxView, memBrain, Mindi, MiWi, MPASM, MPF, MPLAB Certified logo, MPLIB, MPLINK, MultiTRAK, NetDetach, Omniscient Code Generation, PICDEM, PICDEM.net, PICkit, PICtail, PowerSmart, PureSilicon, QMatrix, REAL ICE, Ripple Blocker, RTAX, RTG4, SAM-ICE, Serial Quad I/O, simpleMAP, SimpliPHY, SmartBuffer, SMART-I.S., storClad, SQI, SuperSwitcher, SuperSwitcher II, Switchtec, SynchroPHY, Total Endurance, TSHARC, USBCheck, VariSense, VectorBlox, VeriPHY, ViewSpan, WiperLock, XpressConnect, and ZENA are trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

SQTP is a service mark of Microchip Technology Incorporated in the U.S.A.

The Adaptec logo, Frequency on Demand, Silicon Storage Technology, and Symmcom are registered trademarks of Microchip Technology Inc. in other countries.

GestIC is a registered trademark of Microchip Technology Germany II GmbH & Co. KG, a subsidiary of Microchip Technology Inc., in other countries.
