

TSYS01-FAMILY

Digital Temperature Sensors

Specifications

- High Accuracy Temperature Sensor
- TSYS01: $\pm 0.1^{\circ}\text{C}$ @ Temp.: $-5^{\circ}\text{C} \dots +50^{\circ}\text{C}$
- TSYS01-1: $\pm 0.1^{\circ}\text{C}$ @ Temp.: $-20^{\circ}\text{C} \dots +70^{\circ}\text{C}$
- 16/24 bit Resolution
- Low Power
- SPI/I2C Interface
- QFN16 Package

Features

- High Accuracy
- TSYS01: $\pm 0.1^{\circ}\text{C}$ @ Temp.: $-5^{\circ}\text{C} \dots +50^{\circ}\text{C}$
TSYS01-1: $\pm 0.1^{\circ}\text{C}$ @ Temp.: $-20^{\circ}\text{C} \dots +70^{\circ}\text{C}$
- Adjustment of high accuracy temp. range on request
- Low Current, $< 12.5 \mu\text{A}$ (standby $< 0.14 \mu\text{A}$)
- SPI / I2C Interface
- Small Package: QFN16
- Operating Temperature Range: $-40^{\circ}\text{C} \dots +125^{\circ}\text{C}$

The TSYS01 is a single device, versatile, new technology temperature sensor. The TSYS01 provides factory calibrated temperature information. It includes a temperature sensing chip and a 24-bit $\Delta\Sigma$ -ADC. The essence of the digital 24-bit temperature value and the internal calibration values lead to highly accurate temperature information accompanied by high measurement resolution.

The TSYS01 can be interfaced to any microcontroller by an I2C or SPI interface. This microcontroller has to calculate the temperature result based on the ADC values and the calibration parameters.

Applications

- Industrial Control
- Replacement of Thermistors and NTCs
- Heating / Cooling Systems
- HVAC

The basic operating principle is:

- Converting temperature into digital 16/24 bit ADC value
- Providing calibration coefficients
- Providing ADC value and calibration coefficients by SPI or I2C interface.

Absolute maximum ratings

Absolute maximum ratings are limiting values of permitted operation and should never be exceeded under the worst possible conditions either initially or consequently. If exceeded by even the smallest amount, instantaneous catastrophic failure can occur. And even if the device continues to operate satisfactorily, its life may be considerably shortened.

Interface description

PROTOCOL SELECTION

PS pin input level has to be defined in dependence to protocol selection.

- PS = 0 activates SPI.
- PS = 1 activates I²C.

I²C INTERFACE

A I²C communication message starts with a start condition and it is ended by a stop condition. Each command consists of two bytes: the address byte and command byte.

I²C ADDRESS SELECTION

The I²C address can be selected by CSB pin.

- CSB=1 the address is 1110110x.
- CSB=0 the address is 1110111x.

Therefore, two TSYS01 can be interfaced on the same I²C bus.

SPI INTERFACE

The serial interface is a 4-wire SPI bus, operating as a slave. CS (chip select), SCLK (serial clock), SDI (serial data in), and SDO (serial data out) are used to interact with the SPI master.

Communication with the chip starts when CS is pulled to low and ends when CS is pulled to high.

SCLK is controlled by the SPI master and idles low (SCLK low on CS transitions, mode 0).

A mode where the clock alternatively idles high is also supported (mode 3).

COMMANDS

The commands are the same for SPI and I²C interface.

There are four commands:

- Reset
- Read PROM (calibration parameters)
- Start ADC Temperature conversion
- Read ADC Temperature result

Command	Hex Value
Reset	0x1E
Start ADC Temperature Conversion	0x48
Read ADC Temperature Result	0x00
PROM Read Address 0	0xA0
PROM Read Address 1 (Coefficient k_4)	0xA2
PROM Read Address 2 (Coefficient k_3)	0xA4
PROM Read Address 3 (Coefficient k_2)	0xA6
PROM Read Address 4 (Coefficient k_1)	0xA8
PROM Read Address 5 (Coefficient k_0)	0xAA
PROM Read Address 6 ($SN_{23...8}$)	0xAC
PROM Read Address 7 ($SN_{7...0}$ and Checksum)	0xAE

RESET SEQUENCE

The Reset sequence has to be sent once after power-on. It also can be used to reset the device ROM from an unknown condition.

SPI

I²C

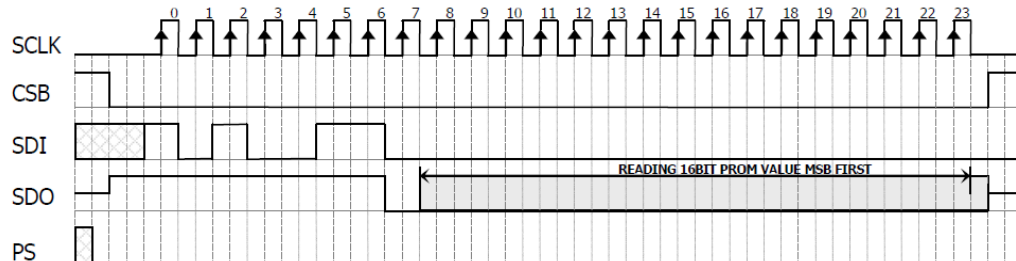

From Master S = Start Condition W = Write A = Acknowledge
 From Slave P = Stop Condition R = Read N = Not Acknowledge

PROM READ SEQUENCE

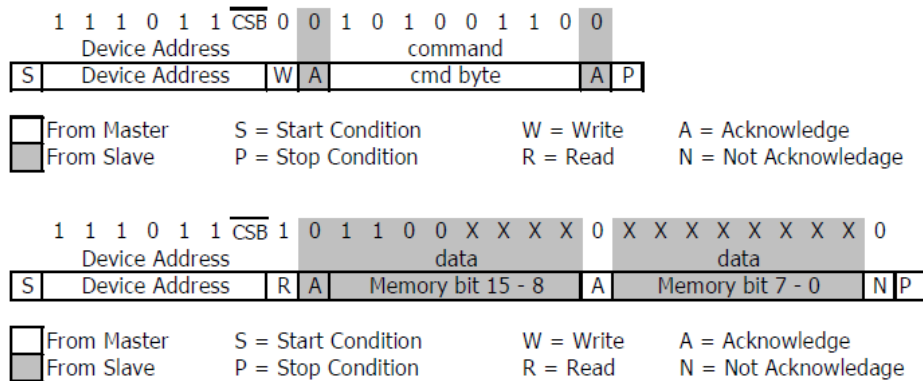

The PROM Read command consists of two parts. First command sets up the system into PROM read mode. The second part gets the data from the system.

Below examples are sequences to read address 3 (command 0xA6).

SPI

I²C

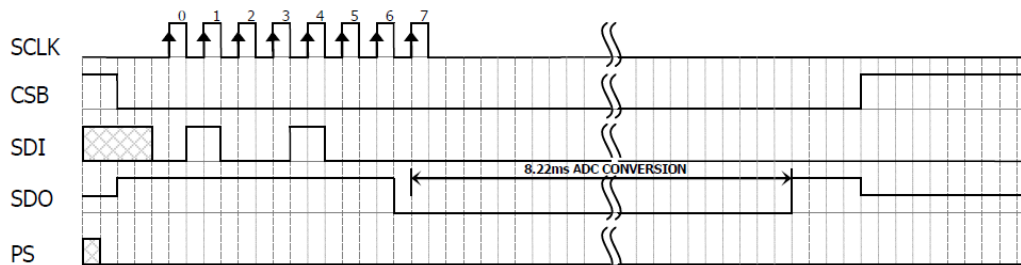

CONVERSION SEQUENCE

A conversion has to be started by sending this command. The sensor stays busy until conversion is done. When conversion is finished the data can be accessed by using ADC read command

SPI

The last clock will start the conversion which TSY01 indicates by pulling SDO low. SDO goes high when conversion is completed.

I²C

When the command is sent the TSYS01 stays busy until the conversion is done. All other commands except the reset command will not be executed during this time. When the conversion is finished the data can be accessed by sending a ADC read command, when an acknowledge appears from TSYS01.

From Master S = Start Condition W = Write A = Acknowledge
 From Slave P = Stop Condition R = Read N = Not Acknowledge

READ ADC RESULT

After the conversion command the ADC result is read using ADC read command. Repeated ADC read commands, or command executed without prior conversion will return all 0 as result.

SPI

I²C

From Master S = Start Condition W = Write A = Acknowledge
 From Slave P = Stop Condition R = Read N = Not Acknowledge

From Master S = Start Condition W = Write A = Acknowledge
 From Slave P = Stop Condition R = Read N = Not Acknowledge

TEMPERATURE POLYNOMIAL

ADC24: ADC value
ADC16: ADC24 / 256

$$T / ^\circ\text{C} = (-2) \cdot k_4 \cdot 10^{-21} \cdot \text{ADC16}^4 + 4 \cdot k_3 \cdot 10^{-16} \cdot \text{ADC16}^3 + (-2) \cdot k_2 \cdot 10^{-11} \cdot \text{ADC16}^2 + 1 \cdot k_1 \cdot 10^{-6} \cdot \text{ADC16} + (-1.5) \cdot k_0 \cdot 10^{-2}$$

EXAMPLE

ADC24: 9378708
 ADC16: $9378708 / 256 = \underline{36636}$

$$\begin{aligned}
 T / ^\circ\text{C} = & (-2) * 28446 * 10^{-21} * 36636^4 + \\
 & 4 * 24926 * 10^{-16} * 36636^3 + \\
 & (-2) * 36016 * 10^{-11} * 36636^2 + \\
 & 1 * 32791 * 10^{-6} * 36636 + \\
 & (-1.5) * 40781 * 10^{-2}
 \end{aligned}$$

$T / ^\circ\text{C} = \underline{10.59}$

Serial number

Content / Description		Command	Size / bit	Example
Bit 16 ... 8	Bit 7 ... 0			
SN _{23...8}		0xAC	16	0x0005 (H ₀ = 0x00, L ₀ = 0x05)
SN _{7...0}	Checksum	0xAE	16	0x96D9 (H ₀ = 0x96, L ₀ = 0xD9)

$$\text{Serial number} = 2^8 \times \text{SN}_{23...8} + \text{SN}_{7...0}$$

EXAMPLE

$$\text{Serial number: } 2^8 \times 5 + 150 = 1430$$

Checksum

In order to check communication and integrity of PROM content, the PROM includes a checksum. By summarization of the complete PROM content in a byte by byte way, the verification can be performed. The lower byte of the sum result has to be 0x00.

EMC

Due to the use of these modules for OEM application no CE declaration is done. Especially line coupled disturbances like surge, burst, HF etc. cannot be removed by the module due to the small board area and low price feature. There is no protection circuit against reverse polarity or over voltage implemented. The module

will be designed using capacitors for blocking and ground plane areas in order to prevent wireless coupled disturbances as good as possible.
