

QHW050D1, QHW075D1, and QHW100D1 Power Modules: dc-dc Converters; 36 to 75 Vdc Input, 2 Vdc Output; 20 W to 40 W

The QHW Series Power Modules use advanced, surface-mount technology and deliver high-quality, efficient, and compact dc-dc conversion.

Applications

- Distributed power architectures
- Communications equipment
- Computer equipment

Options

- Heat sinks available for extended operation
- Auto-restart after overcurrent shutdown

Description

The QHW050D1, QHW075D1, and QHW100D1 Power Modules are dc-dc converters that operate over an input voltage range of 36 Vdc to 75 Vdc and provide a precisely regulated dc output. The outputs are fully isolated from the inputs, allowing versatile polarity configurations and grounding connections. The modules have maximum power ratings from 20 W to 40 W at a typical full-load efficiency of 82%.

The sealed modules offer a metal baseplate for excellent thermal performance. Threaded-through holes are provided to allow easy mounting or addition of a heat sink for high-temperature applications. The standard feature set includes remote sensing, output trim, and remote on/off for convenient flexibility in distributed power applications.

Features

- Small size: 36.8 mm x 57.9 mm x 12.7 mm (1.45 in. x 2.28 in. x 0.50 in.)
- High power density
- Extra high efficiency: 82% typical
- Low output noise
- Constant frequency
- Industry-standard pinout
- Metal baseplate
- 2:1 input voltage range
- Overvoltage and overcurrent protection
- Remote on/off
- Remote sense
- Adjustable output voltage
- Overtemperature protection
- ISO* 9001 Certified manufacturing facilities
- UL† 1950 Recognized, CSA‡ C22.2 No. 950-95 Certified, and VDE§ 0805 (EN60950, IEC950) Licensed
- CE mark meets 73/23/EEC and 93/68/EEC directives**

* ISO is a registered trademark of the International Organization for Standardization.

† UL is a registered trademark of Underwriters Laboratories, Inc.

‡ CSA is a registered trademark of Canadian Standards Assn.

§ VDE is a trademark of Verband Deutscher Elektrotechniker e.V.

** This product is intended for integration into end-use equipment. All the required procedures for CE marking of end-use equipment should be followed. (The CE mark is placed on selected products.)

Absolute Maximum Ratings

Stresses in excess of the absolute maximum ratings can cause permanent damage to the device. These are absolute stress ratings only. Functional operation of the device is not implied at these or any other conditions in excess of those given in the operations sections of the data sheet. Exposure to absolute maximum ratings for extended periods can adversely affect device reliability.

Parameter	Symbol	Min	Max	Unit
Input Voltage: Continuous	V_I	—	80	Vdc
Transient (100 ms)	$V_{I, trans}$	—	100	V
Operating Case Temperature (See Thermal Considerations section.)	T_C	−40	100	°C
Storage Temperature	T_{stg}	−55	125	°C
I/O Isolation Voltage (for 1 minute)	—	—	1500	Vdc

Electrical Specifications

Unless otherwise indicated, specifications apply over all operating input voltage, resistive load, and temperature conditions.

Table 1. Input Specifications

Parameter	Symbol	Min	Typ	Max	Unit
Operating Input Voltage	V_I	36	48	75	Vdc
Maximum Input Current ($V_I = 0$ V to 75 V; $I_O = I_{O, max}$; see Figure 1):					
QHW050D1	$I_{I, max}$	—	—	TBD	A
QHW075D1	$I_{I, max}$	—	—	TBD	A
QHW100D1	$I_{I, max}$	—	—	2.2	A
Inrush Transient	i^2t	—	—	1.0	A ² s
Input Reflected-ripple Current, Peak-to-peak (Measured at fundamental switching frequency, 12 μ H source impedance; see Figure 7.)	—	—	10	—	mAp-p
Input Ripple Rejection (100—120 Hz)	—	—	60	—	dB

Fusing Considerations

CAUTION: This power module is not internally fused. An input line fuse must always be used.

This encapsulated power module can be used in a wide variety of applications, ranging from simple stand-alone operation to an integrated part of a sophisticated power architecture. To preserve maximum flexibility, internal fusing is not included; however, to achieve maximum safety and system protection, always use an input line fuse. The safety agencies require a normal-blow fuse with a maximum rating of 20 A (see Safety Considerations section). Based on the information provided in this data sheet on inrush energy and maximum dc input current, the same type of fuse with a lower rating can be used. Refer to the fuse manufacturer's data for further information.

Electrical Specifications (continued)

Table 2. Output Specifications

Parameter	Device	Symbol	Min	Typ	Max	Unit
Output Voltage Set Point ($V_I = 48\text{ V}$; $I_O = I_{O, \max}$; $T_C = 25\text{ }^\circ\text{C}$)	All	$V_{O, \text{set}}$	1.97	2.0	2.03	Vdc

Overtemperature Protection	T_C	—	105	—	$^{\circ}\text{C}$

Post solder cleaning is usually the final circuit-board assembly process prior to electrical testing. The result of inadequate circuit-board cleaning and drying can affect both the reliability of a power module and the testability of the finished circuit-board assembly. For guidance on appropriate soldering, cleaning, and drying procedures, refer to the *Board-Mounted Power Modules Soldering and Cleaning* Application Note (AP97-021EPS).

Characteristic Curves

The following figures provide typical characteristics for the power modules. The figures are identical for both on/off configurations.

Figure 1. Typical QHW100D1 Input Characteristics at Room Temperature

Figure 3. Typical QHW100D1 Output Ripple Voltage at Room Temperature; $I_o = I_{o, max}$

Figure 2. Typical QHW100D1 Converter Efficiency vs. Output Current at Room Temperature

Note: Tested with a 220 μ F aluminum and a 1.0 μ F ceramic capacitor across the load.

Figure 4. Typical QHW100D1 Transient Response to Step Decrease in Load from 50% to 25% of Full Load at Room Temperature and 54 Vdc Input. (Waveform Averaged to Eliminate Ripple Component.)

Characteristic Curves (continued)

Note: Tested with a 220 μF aluminum and a 1.0 μF ceramic capacitor across the load.

Figure 6. QHW100D1 Typical Start-Up from Remote On/Off; $I_o = I_{o, max}$

Test Configurations

Note: Measure input reflected-ripple current with a simulated source inductance (L_{TEST}) of 12 μH. Capacitor C_s offsets possible battery impedance. Measure current as shown above.

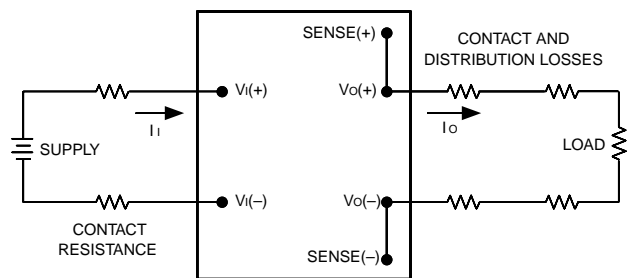

Figure 7. Input Reflected-Ripple Test Setup

8-513 (C).d

Note: Use a 1.0 μF ceramic capacitor and a 10 μF aluminum or tantalum capacitor. Scope measurement should be made using a BNC socket. Position the load between 51 mm and 76 mm (2 in. and 3 in.) from the module.

Figure 8. Peak-to-Peak Output Noise Measurement Test Setup

8-749 (C)

Note: All measurements are taken at the module terminals. When socketing, place Kelvin connections at module terminals to avoid measurement errors due to socket contact resistance.

$$\eta = \left(\frac{[V_o(+)-V_o(-)]I_o}{[V_i(+)-V_i(-)]I_i} \right) \times 100 \quad \%$$

Figure 9. Output Voltage and Efficiency Measurement Test Setup

Design Considerations

Input Source Impedance

The power module should be connected to a low ac-impedance input source. Highly inductive source impedances can affect the stability of the power module. For the test configuration in Figure 7, a 33 μ F electrolytic capacitor ($ESR < 0.7 \frac{3}{4}$ at 100 kHz) mounted close to the power module helps ensure stability of the unit. For other highly inductive source impedances, consult the factory for further application guidelines.

Safety Considerations

For safety-agency approval of the system in which the power module is used, the power module must be installed in compliance with the spacing and separation requirements of the end-use safety agency standard, i.e., *UL1950*, *CSA C22.2 No. 950-95*, and *VDE 0805 (EN60950, IEC950)*.

If the input source is non-SELV (ELV or a hazardous voltage greater than 60 Vdc and less than or equal to 75 Vdc), for the module's output to be considered meeting the requirements of safety extra-low voltage (SELV), all of the following must be true:

- The input source is to be provided with reinforced insulation from any hazardous voltages, including the ac mains.
- One V_I pin and one V_O pin are to be grounded or both the input and output pins are to be kept floating.
- The input pins of the module are not operator accessible.
- Another SELV reliability test is conducted on the whole system, as required by the safety agencies, on the combination of supply source and the subject module to verify that under a single fault, hazardous voltages do not appear at the module's output.

Note: Do not ground either of the input pins of the module, without grounding one of the output pins. This may allow a non-SELV voltage to appear between the output pin and ground.

The power module has extra-low voltage (ELV) outputs when all inputs are ELV.

The input to these units is to be provided with a maximum 20 A normal-blow fuse in the ungrounded lead.

Feature Descriptions

Overcurrent Protection

To provide protection in a fault (output overload) condition, the unit is equipped with internal current-limiting circuitry and can endure current limiting, typically 40 ms. If overcurrent exists for more than 40 ms, the unit will shut down.

At the point of current-limit inception, the unit shifts from voltage control to current control. If the output voltage is pulled very low during a severe fault, the current-limit circuit can exhibit either foldback or tailout characteristics (output current decrease or increase).

The module is available in two overcurrent configurations. In one configuration, when the unit shuts down it will latch off. The overcurrent latch is reset by either cycling the input power or by toggling the ON/OFF pin for one second. In the other configuration, the unit will try to restart after shutdown. If the output overload condition still exists when the unit restarts, it will shut down again. This operation will continue indefinitely until the overcurrent condition is corrected.

Remote On/Off

Negative logic remote on/off turns the module off during a logic high and on during a logic low. Negative logic, device code suffix "1," is the factory-preferred configuration.

To turn the power module on and off, the user must supply a switch to control the voltage between the on/off terminal and the $V_I(-)$ terminal ($V_{on/off}$). The switch can be an open collector or equivalent (see Figure 10). A logic low is $V_{on/off} = 0$ V to 1.2 V. The maximum $I_{on/off}$ during a logic low is 1 mA. The switch should maintain a logic-low voltage while sinking 1 mA.

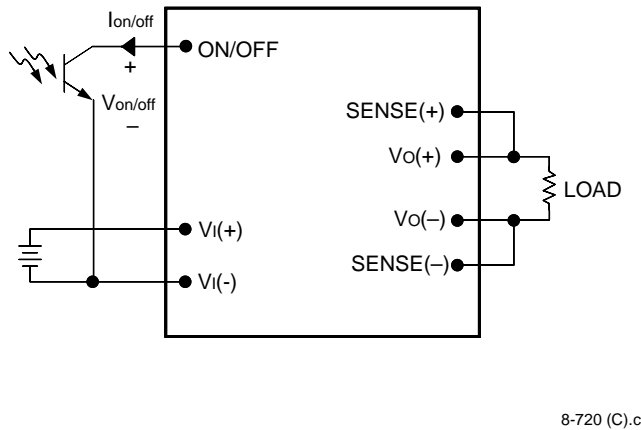

During a logic high, the maximum $V_{on/off}$ generated by the power module is 15 V. The maximum allowable leakage current of the switch at $V_{on/off} = 15$ V is 50 μ A.

If not using the remote on/off feature, do one of the following:

- For negative logic, short ON/OFF pin to $V_I(-)$.

Feature Descriptions (continued)

Remote On/Off (continued)

8-720 (C).c

Figure 10. Remote On/Off Implementation

Remote Sense

Remote sense minimizes the effects of distribution losses by regulating the voltage at the remote-sense connections. The voltage between the remote-sense pins and the output terminals must not exceed the output voltage sense range given in the Feature Specifications table, i.e.:

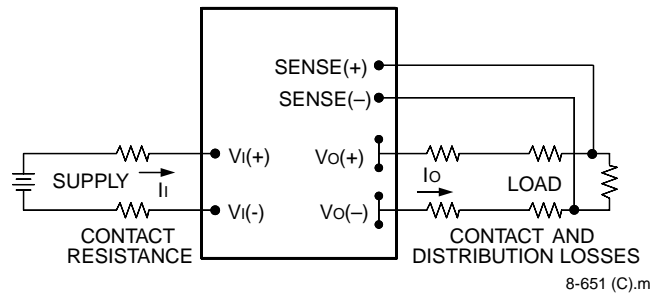

$$[V_o(+)-V_o(-)]-[SENSE(+)-SENSE(-)] \leq 0.2 \text{ V}$$

The voltage between the Vo(+) and Vo(-) terminals must not exceed the minimum output overvoltage protection value shown in the Feature Specifications table. This limit includes any increase in voltage due to remote-sense compensation and output voltage set-point adjustment (trim). See Figure 11.

If not using the remote-sense feature to regulate the output at the point of load, then connect SENSE(+) to Vo(+) and SENSE(-) to Vo(-) at the module.

Although the output voltage can be increased by both the remote sense and by the trim, the maximum increase for the output voltage is not the sum of both. The maximum increase is the larger of either the remote sense or the trim. Consult the factory if you need to increase the output voltage more than the above limitation.

The amount of power delivered by the module is defined as the voltage at the output terminals multiplied by the output current. When using remote sense and trim, the output voltage of the module can be increased, which at the same output current would increase the power output of the module. Care should be taken to ensure that the maximum output power of the module remains at or below the maximum rated power.

8-651 (C).m

Figure 11. Effective Circuit Configuration for Single-Module Remote-Sense Operation

Output Voltage Set-Point Adjustment (Trim)

Output voltage trim allows the user to increase or decrease the output voltage set point of a module. This is accomplished by connecting an external resistor between the TRIM pin and either the SENSE(+) or SENSE(-) pins. The trim resistor should be positioned close to the module.

If not using the trim feature, leave the TRIM pin open.

With an external resistor between the TRIM and SENSE(-) pins ($R_{\text{adj-down}}$), the output voltage set point ($V_{o, \text{adj}}$) decreases (see Figure 12). The following equation determines the required external-resistor value to obtain a percentage output voltage change of $\Delta\%$.

$$R_{\text{adj-down}} = \left(\frac{511}{\Delta\%} - 10.22 \right) \text{ k}\Omega$$

The test results for this configuration are displayed in Figure 13. This figure applies to all output voltages.

With an external resistor connected between the TRIM and SENSE(+) pins ($R_{\text{adj-up}}$), the output voltage set point ($V_{o, \text{adj}}$) increases (see Figure 14).

The following equation determines the required external-resistor value to obtain a percentage output voltage change of $\Delta\%$.

$$R_{\text{adj-up}} = \left(\frac{5.11 V_o (100 + \Delta\%)}{1.225 \Delta\%} - \frac{511}{\Delta\%} - 10.22 \right) \text{ k}\Omega$$

Feature Descriptions (continued)

Output Voltage Set-Point Adjustment (Trim)

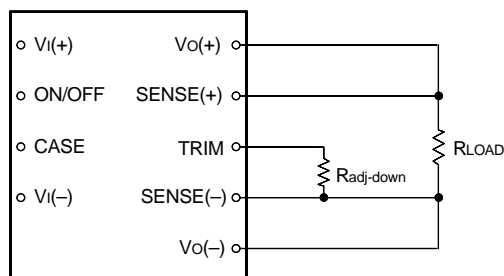

(continued)

The test results for this configuration are displayed in Figure 15.

The voltage between the Vo(+) and Vo(-) terminals must not exceed the minimum output overvoltage protection value shown in the Feature Specifications table. This limit includes any increase in voltage due to remote-sense compensation and output voltage set-point adjustment (trim). See Figure 11.

Although the output voltage can be increased by both the remote sense and by the trim, the maximum increase for the output voltage is not the sum of both. The maximum increase is the larger of either the remote sense or the trim. Consult the factory if you need to increase the output voltage more than the above limitation.

The amount of power delivered by the module is defined as the voltage at the output terminals multiplied by the output current. When using remote sense and trim, the output voltage of the module can be increased, which at the same output current would increase the power output of the module. Care should be taken to ensure that the maximum output power of the module remains at or below the maximum rated power.

8-748 (C).b

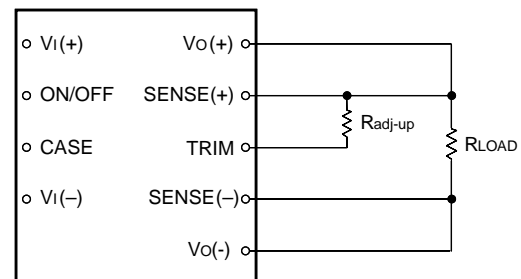

Figure 12. Circuit Configuration to Decrease Output Voltage

Note: The output voltage of this module may be increased to a maximum of 0.2 V. The 0.2 V is the combination of both the remote-sense and the output voltage set-point adjustment (trim). Do not exceed 2.2 V between the Vo(+) and Vo(-) terminals.

8-3040 (F)

8-715 (C).b

Figure 14. Circuit Configuration to Increase Output Voltage

Feature Descriptions (continued)

Output Voltage Set-Point Adjustment (Trim)

(continued)

Figure 15. Resistor Selection for Increased Output Voltage

Output Overvoltage Protection

The output overvoltage protection consists of circuitry that monitors the voltage on the output terminals. If the voltage on the output terminals exceeds the overvoltage protection threshold, then the module will shut down and latch off. The overvoltage latch is reset by either cycling the input power for 1.0 second or by toggling the on/off signal for 1.0 second.

Overtemperature Protection

These modules feature an overtemperature protection circuit to safeguard against thermal damage. The circuit shuts down and latches off the module when the maximum case temperature is exceeded. The module can be restarted by cycling the dc input power for at least 1.0 second or by toggling the remote on/off signal for at least 1.0 second. If the auto-restart option is chosen, the unit will "hiccup" until the temperature is within specification.

Thermal Considerations

Introduction

The power modules operate in a variety of thermal environments; however, sufficient cooling should be provided to help ensure reliable operation of the unit. Heat-dissipating components inside the unit are thermally coupled to the case. Heat is removed by conduction, convection, and radiation to the surrounding environment. Proper cooling can be verified by measuring the case temperature. Peak temperature (T_C) occurs at the position indicated in Figure 16.

Note: Top view, pin locations are for reference only.
Measurements shown in millimeters and (inches).

Figure 16. Case Temperature Measurement Location

The temperature at this location should not exceed 100 °C. The output power of the module should not exceed the rated power for the module as listed in the Ordering Information table.

Although the maximum case temperature of the power modules is 100 °C, you can limit this temperature to a lower value for extremely high reliability.

Heat Transfer Without Heat Sinks

Increasing airflow over the module enhances the heat transfer via convection. Figure 17 shows the maximum power that can be dissipated by the module without exceeding the maximum case temperature versus local ambient temperature (T_A) for natural convection through 3 m/s (600 ft./min.).

Note that the natural convection condition was measured at 0.05 m/s to 0.1 m/s (10 ft./min. to 20 ft./min.); however, systems in which these power modules may be used typically generate natural convection airflow rates of 0.3 m/s (60 ft./min.) due to other heat dissipating components in the system. The use of Figure 17 is shown in the following example.

Thermal Considerations (continued)

Heat Transfer Without Heat Sinks (continued)

Example

What is the minimum airflow necessary for a QHW100D1 operating at $V_I = 54$ V, an output current of 15 A, transverse orientation, and a maximum ambient temperature of 40 °C?

Solution

Given: $V_I = 54$ V
 $I_O = 15$ A
 $T_A = 40$ °C

Determine P_D (Use Figure 19):

$$P_D = 6.3 \text{ W}$$

Determine airflow (v) (Use Figure 17):

$$v = 0.1 \text{ m/s (20 ft./min.)}$$

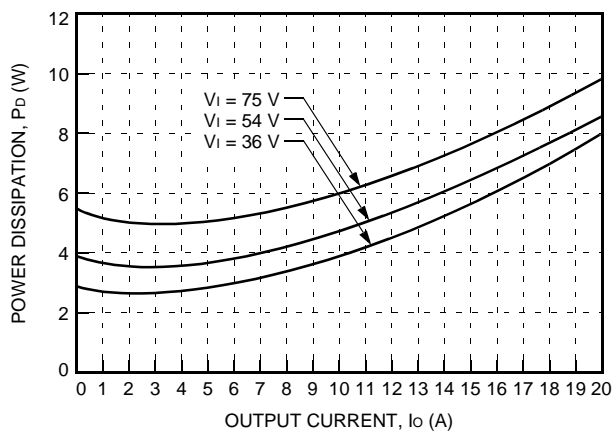

8-2321 (C)

Figure 17. Forced Convection Power Derating with No Heat Sink; Transverse Orientation

8-2318 (C).a

Figure 18. Forced Convection Power Derating with No Heat Sink; Longitudinal Orientation

8-3041 (F)

Figure 19. QHW100D1 Power Dissipation vs. Output Current

Thermal Considerations (continued)

Heat Transfer with Heat Sinks

The power modules have through-threaded, M3 x 0.5 mounting holes, which enable heat sinks or cold plates to attach to the module. The mounting torque must not exceed 0.56 N-m (5 in.-lb.). For a screw attachment from the pin side, the recommended hole size on the customer's PWB around the mounting holes is 0.130 ± 0.005 inches. If a larger hole is used, the mounting torque from the pin side must not exceed 0.25 N-m (2.2 in.-lbs.).

Thermal derating with heat sinks is expressed by using the overall thermal resistance of the module. Total module thermal resistance (θ_{ca}) is defined as the maximum case temperature rise ($\Delta T_{C, max}$) divided by the module power dissipation (P_D):

$$\theta_{ca} = \left[\frac{\Delta T_{C, max}}{P_D} \right] = \left[\frac{(T_C - T_A)}{P_D} \right]$$

The location to measure case temperature (T_C) is shown in Figure 16. Case-to-ambient thermal resistance vs. airflow is shown, for various heat sink configurations, heights, and orientations, as shown in Figures 20 and 21. Longitudinal orientation is defined as when the long axis of the module is parallel to the airflow direction, whereas in the transverse orientation, the long axis is perpendicular to the airflow. These curves were obtained by experimental testing of heat sinks, which are offered in the product catalog.

8-2323 (C)

Figure 20. Case-to-Ambient Thermal Resistance Curves; Transverse Orientation

8-2324 (C)

Figure 21. Case-to-Ambient Thermal Resistance Curves; Longitudinal Orientation

8-2889 (C)

Figure 22. Heat Sink Power Derating Curves; Natural Convection; Transverse Orientation

Thermal Considerations (continued)

Heat Transfer with Heat Sinks (continued)

**Figure 23. Heat Sink Power Derating Curves;
Natural Convection; Longitudinal
Orientation**

**Figure 24. Heat Sink Power Derating Curves;
1.0 m/s (200 lfm); Transverse Orientation**

**Figure 25. Heat Sink Power Derating Curves;
1.0 m/s (200 lfm); Longitudinal
Orientation**

These measured resistances are from heat transfer from the sides and bottom of the module as well as the top side with the attached heat sink; therefore, the case-to-ambient thermal resistances shown are generally lower than the resistance of the heat sink by itself. The module used to collect the data in Figure 20 had a thermal-conductive dry pad between the case and the heat sink to minimize contact resistance. The use of Figure 20 is shown in the following example.

Example

If an 85 °C case temperature is desired, what is the minimum airflow necessary? Assume the QHW100D1 module is operating at $V_I = 54$ V and an output current of 20 A, maximum ambient air temperature of 40 °C, and the heat sink is 1/2 inch. The module is oriented in the transverse direction.

Solution

Given: $V_I = 54$ V
 $I_O = 20$ A
 $T_A = 40$ °C
 $T_C = 85$ °C
 Heat sink = 1/2 inch

Determine P_D by using Figure 19:

$$P_D = 8.5 \text{ W}$$

Thermal Considerations (continued)

Heat Transfer with Heat Sinks (continued)

Then solve the following equation:

$$\theta_{ca} = \left[\frac{(T_C - T_A)}{P_D} \right]$$

$$\theta_{ca} = \left[\frac{(85 - 40)}{8.5} \right]$$

$$\theta_{ca} = 5.3 \text{ } ^\circ\text{C/W}$$

Use Figure 20 to determine air velocity for the 1/2 inch heat sink.

The minimum airflow necessary for this module is 0.4 m/s (80 ft./min.).

Custom Heat Sinks

A more detailed model can be used to determine the required thermal resistance of a heat sink to provide necessary cooling. The total module resistance can be separated into a resistance from case-to-sink (θ_{cs}) and sink-to-ambient (θ_{sa}) as shown in Figure 26.

8-1304 (C)

Figure 26. Resistance from Case-to-Sink and Sink-to-Ambient

For a managed interface using thermal grease or foils, a value of $\theta_{cs} = 0.1 \text{ } ^\circ\text{C/W}$ to $0.3 \text{ } ^\circ\text{C/W}$ is typical. The solution for heat sink resistance is:

$$\theta_{sa} = \left[\frac{(T_C - T_A)}{P_D} \right] - \theta_{cs}$$

This equation assumes that all dissipated power must be shed by the heat sink. Depending on the user-defined application environment, a more accurate model, including heat transfer from the sides and bottom of the module, can be used. This equation provides a conservative estimate for such instances.

EMC Considerations

For assistance with designing for EMC compliance, please refer to the FLTR100V10 data sheet (DS99-294EPS).

Layout Considerations

Copper paths must not be routed beneath the power module mounting inserts. For additional layout guidelines, refer to the FLTR100V10 data sheet (DS99-294EPS).

Input Voltage	Output Voltage	Output Power	Remote On/Off Logic	Device Code	Comcode
48 V	2 V	20 W	Negative	QHW050D1	TBD
48 V	2 V	30 W	Negative	QHW075D1	108447053
48 V	2 V	40 W	Negative	QHW100D1	108447079

Optional features can be ordered using the suffixes shown in Table 5. The suffixes follow the last letter of the device code and are placed in descending order. For example, the device codes for a QHW100D1 module with the following options are shown below:

Negative logic QHW100D1
 Negative logic and auto-restart after overcurrent shutdown QHW100D41

Table 5. Device Options

Option	Suffix
Auto-restart after overtemp or overcurrent shutdown	4
Negative remote on/off logic	1

Ordering Information (continued)

Table 6. Device Accessories

Accessory	Comcode
1/4 in. transverse kit (heat sink, thermal pad, and screws)	848060992
1/4 in. longitudinal kit (heat sink, thermal pad, and screws)	848061008
1/2 in. transverse kit (heat sink, thermal pad, and screws)	848061016
1/2 in. longitudinal kit (heat sink, thermal pad, and screws)	848061024
1 in. transverse kit (heat sink, thermal pad, and screws)	848061032
1 in. longitudinal kit (heat sink, thermal pad, and screws)	848061040
